

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

HARVARD COLLEGE LIBRARY
GIFT OF
MISS ELLEN L. WENTWORTH

MAY 8 1939

Entered according to Act of Congress, in the year 1888, by
G. A. WENTWORTH,
in the office of the Librarian of Congress, at Washington.

TYPOGRAPHY BY J. S. CUSHING & Co., BOSTON.

PRESSWORK BY GINN & Co., BOSTON.

PREFACE.

THIS edition is intended for teachers, and for them only. The publishers will make every effort to keep the book from pupils; and teachers are urged to exercise the utmost care not to lose their copies, or to leave them where pupils can have access to them.

It is hoped that young teachers will derive great advantage from studying the systematic arrangement of the arithmetical work, for such attention has been paid to this as the limitation of the page would allow.

It is also expected that many teachers, who are pressed for time, will find great relief by not being obliged to work out every problem in the Arithmetic.

G. A. WENTWORTH.

PHILLIPS EXETER ACADEMY,
August, 1888.

Starting 90 miles south of Chicago, I go 50 miles due north; and the next day 80 miles, still north. How far from Chicago am I now?
 $-90 + 50 + 80 = -90 + 130 = 40$, the number of miles north. *Ans.*

With only \$67 I undertake to pay three bills, of \$47, of \$13, and of \$11. Can I pay the bills? How much shall I lack?

EXERCISE VIII.

1. If a stone weighs 1.3^{ks} in air and 0.68^{ks} in water, and the stone and a block of wood together weigh 1.55^{ks} in air and 0.63^{ks} in water, what is the specific gravity of the block of wood?

1.55^{ks} - 1.3^{ks} = 0.25^{ks}, the weight of the wood in the air

1.55^{ks} - 0.63^{ks} = 0.92^{ks}, the weight of water displaced by the stone and the wood.

1.3^{ks} - 0.68^{ks} = 0.62^{ks}, the weight of water displaced by the stone alone.

Therefore 0.92^{ks} - 0.62^{ks} = 0.3^{ks}, the weight of water displaced by the wood.

And 0.25 ÷ 0.3 = 0.833, the specific gravity of the wood.

EXERCISE X.

1. A train leaves Paris at 11 o'clock A.M., and reaches Lyons at 10 o'clock P.M. How many meters does it travel in a hour, the distance from Paris to Lyons being 512.7^{km}?

There are 11 hours between 11 A.M. and 10 P.M. Therefore the train runs $512.7^{\text{km}} \div 11 = 46.609^{\text{km}} = 46,609^{\text{m}}$.

2. A railroad has a single track 11.450^{km} long. How many rails 4.569^m in length did it require to lay the track?

There are two lines of rails. Therefore length of rails is

$$2 \times 11.450^{\text{km}} = 22.900^{\text{km}} = 22,900^{\text{m}}.$$

Therefore the number of rails is $22,900 \div 4.569$.

6. The cost of building a railroad is about \$78,000 a kilometer in France, and only \$25,000 in the United States. How much would it cost in each country to make a road 295.671^{km} long?

The cask will hold 275.8^{kg} - 17.06^{kg} = 258.74^{kg} of water. It takes 258.74^l of water to weigh 258.74^{kg}. Therefore the cask will hold 258.74^l.

$5.35^m = 535^{cm}$. $4.30^m = 430^{cm}$. The volume of the oak beam is $67,258.596992^s + 1.026^s = 65,554.188^{cm}$. The area of one side of the oak beam is $430 \times 9.12 = 3921.6^{cm}$; therefore thickness is $65,554.188^{cm} \div 3921.6^{cm} = 16.72^{cm}$.

58. Give the specific gravity and volume of a body weighing 35^{kg} in air and 30^{kg} in water.

The weight of water displaced by the body is 5^{kg} .

The weight of body in air is 35^{kg} .

Therefore specific gravity is $35 \div 5 = 7$. 35^l of water weigh 35^{kg} ; $35 \div 7 = 5^l$, volume.

59. A ster of piled oak wood weighs 425^{ks} ; the specific gravity of the wood is 0.74. What is the volume occupied by the spaces between the logs? For how much must 100^{ks} of separate sticks be sold in order to bring the same amount as when sold by the ster; a ster selling for \$2.20?

If there were no spaces between the logs, the ster of wood would weigh 740^{ks} . Therefore the spaces, if filled with wood, would weigh $740^{\text{ks}} - 425^{\text{ks}} = 315^{\text{ks}}$. Therefore volume of spaces is $315 \div 740 = 0.42568^{\text{cbm}}$. 100^{ks} ought to be sold for $\frac{1}{4}\frac{1}{2}$ of \$2.20 = \$2.20 \div 425 = \$0.518.

\$7.00 per 100^{ks} is the same as \$0.07 per kilogram. An iron bar that costs \$5.08 must weigh $5.08 \div 0.07 = 72.57143^{\text{ks}}$, and its volume is $72.57143 \div 7.4 = 9.8066^{\text{l}} = 9806.5^{\text{ccm}}$. $$45^{\text{cm}} = 0.45^{\text{m}}; 37^{\text{cm}} = 0.37^{\text{m}}; 2,65^{\text{m}} = 265^{\text{cm}}.$$

Total area of the glass is 0.75 of $265^{\text{cm}} = 198.75^{\text{cm}}$. The area of one pane is $0.45 \times 0.37 = 0.1665^{\text{cm}}$. Therefore the number of panes needed is $198.75 \div 0.1665 = 1194$. At $\$0.95$ per square meter, 198.75^{cm} will cost $198.75 \times \$0.95 = \188.81 .

68. A jar full of water weighs 1.325^{kg} ; filled with mercury it weighs 12.540^{kg} . What is the capacity of the jar, and its weight? The specific gravity of the mercury is 13.59 .

The weight of the jar and the jar full of mercury is 12.540^{kg} . The weight of the jar and the jar full of water is 1.325^{kg} . Therefore the difference in weight between the mercury and the water is $12.540^{\text{kg}} - 1.325^{\text{kg}} = 11.215^{\text{kg}}$. $13.59 - 1 = 12.59$, the specific gravity of a liquid of which the jar full without the jar weighs 11.215^{kg} . Hence the capacity of the jar is $11.215 \div 12.59 = 0.89079^{\text{l}}$. 0.89079^{l} of water weigh 0.89079^{kg} . Therefore weight of jar is $1.325 - 0.89079 = 0.43421^{\text{kg}} = 434.21^{\text{g}}$.

69. A hektoliter of rape-seed weighs 63^{ks} , and 32^{l} of oil can be extracted from it. How many kilograms of the seed will it take to make a hektoliter of oil?

$1^{\text{hl}} = 100^{\text{l}}$. If 32^{l} of oil can be extracted from 63^{ks} of seed, 1^{l} of oil can be extracted from $63 \div 32 = 1.96875^{\text{ks}}$ of seed, and 100^{l} of oil can be extracted from $100 \times 1.96875^{\text{ks}} = 196.875^{\text{ks}}$ of seed.

70. Common burning gas is 0.97 of the weight of air, and a liter of air weighs 1.293^{s} . In a shop there are 65 jets, each one of which burns 123^{l} an hour, and is used 5 hours in the winter evenings. Calculate the weight of the gas used in a month, and the expense of lighting the shop, when gas costs 6 cents a cubic meter.

1^{l} of gas weighs $0.97 \times 1.293^{\text{s}} = 1.25421^{\text{s}}$. 65 jets, each burning 123^{l} an hour, and used 5 hours an evening for 30 days, will use $65 \times 5 \times 30 \times 123^{\text{l}} = 1,199,250^{\text{l}}$, the weight of which is $1,199,250 \times 1.25421^{\text{s}} = 1,504,111.34^{\text{s}} = 1504.11134^{\text{ks}}$. $1,199,250^{\text{l}} = 1199.25^{\text{cbm}}$. The expense at \$0.06 per cubic meter is $1199.25 \times \$0.06 = \71.96 .

71. A merchant buys one kind of wine at 30 cents a liter, another kind at 21 cents a liter; he mixes the two kinds by putting 5^l of the first with 8^l of the second. For how much a liter must he sell the mixture in order to gain \$3.75 a hektoliter?

5^l at \$0.30 per liter cost \$1.50.

8^l at \$0.21 per liter cost \$1.68.

Therefore 13^l of the mixture cost $\$1.50 + \$1.68 = \$3.18$, and 1^l costs $\$3.18 \div 13 = \0.2446 . Again, if \$3.75 per hektoliter is equivalent to a gain of \$0.0375 per liter, to make \$3.75 per hektoliter the merchant must sell the wine for $\$0.0375 + \$0.2446 = \$0.2821$ per liter.

72. If it requires 360 tiles to drain an ar of land, what will it cost to drain 17.784^{ha}, when the tiles cost \$20 a thousand, and the expense of laying is the same as the cost of the tiles?

The expense of laying the tiles and their cost is \$40 per thousand. $17.784^{\text{ha}} = 1778.4^{\text{a}}$. To drain 1778.4^a of land 1778.4×360 tiles = 640,224 tiles = 640.224 thousand are needed. 640.224 thousand at \$40 per thousand cost $640.224 \times \$40 = \$25,608.96$. *Ans.*

73. It is found in building that hewn stone of medium durability ought not to support, as a permanent weight, more than 0.07 of the

weight that it would require to crush it. A certain kind of stone used for building will be crushed under a weight of 250^{ks} a square centimeter. What is the greatest height to which a wall constructed of this material can be safely carried, the specific gravity of the stone being 2.1?

250^{ks} per square centimeter is equivalent to $250,000^{\text{s}}$ per square centimeter. 0.07 of $250,000^{\text{s}} = 17,500^{\text{s}}$ ought to be the pressure on a square centimeter. Therefore volume of imaginary prism ought to be $17,500 \div 2.1 = 8333.33^{\text{cm}}$, or the height ought to be $8333.33^{\text{cm}} = 83.333^{\text{m}}$.

75. A farmer wishes to drain a field of 8.75^{ha} . Each hektar requires 750^{m} of ditches. The opening of these ditches costs 10 cents a running meter; the tiles are 30^{cm} long, and cost $\$15$ a thousand. He pays 2 cents a meter for laying the tiles, and 4 cents a meter for filling the ditches. What is the cost of draining the field?

There are required $8.75 \times 750^m = 6562.5^m$ of ditches. The expense of opening the ditches, laying the tiles, and filling the ditches is $\$0.10 + \$0.02 + \$0.04 = \0.16 per meter. 6562.5^m will cost $6562.5 \times \$0.16 = \1050.00 . $30^m = 0.3^m$. For 6562.5^m , $6562.5 \div 0.3 = 21,875$ tiles are necessary. The tiles cost \$15 per thousand. Therefore 21.875 thousand cost $21.875 \times \$15 = \328.13 . Hence cost of draining the field is $\$1050.00 + \$328.13 = \$1378.13$.

21. If A can mow a certain meadow in 4 days, and B in 3 days, how long will it take both?

If A can mow it in 4 days, in one day he can mow $\frac{1}{4}$ of it.
If B can mow it in 3 days, in one day he can mow $\frac{1}{3}$ of it.
Both together can mow $\frac{1}{4} + \frac{1}{3} = \frac{7}{12}$ of it in one day.
 \therefore both together can mow the whole in $\frac{12}{7}$ days, or $1\frac{5}{7}$ days. *Ans.*

22. If A can lay a certain wall in $4\frac{1}{2}$ days, and B in $5\frac{1}{2}$ days, how long will it take both?

If A can do it in $4\frac{1}{2}$ days, in one day he can do $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.
can do it in $5\frac{1}{2}$ days, in one day he can do $\frac{1}{5\frac{1}{2}} = \frac{2}{11}$ of it.
together can do $\frac{2}{9} + \frac{2}{11} = \frac{38}{99}$ of it in one day.
both together can do the whole in $\frac{99}{38}$ days, or $2\frac{13}{38}$ days. *Ans.*

a pipe will fill a vessel in $4\frac{1}{2}$ hours, and another in $3\frac{1}{2}$ hours;
will it take both to fill the vessel?

the pipe will fill it in $4\frac{1}{2}$ hrs., in one hr. it will fill $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.
other pipe will fill it in $3\frac{1}{2}$ hrs., in one hr. it will fill $\frac{1}{3\frac{1}{2}} = \frac{2}{7}$ of it.
pipes together will fill $\frac{2}{9} + \frac{2}{7} = \frac{32}{63}$ of it in one hour.
both pipes together will fill it in $\frac{63}{32} = 1\frac{31}{32}$ hrs. = 1 hr. 58 min. $7\frac{1}{2}$ sec. *Ans.*

24. If A can go from Boston to Albany in $9\frac{1}{4}$ hours, and B from Albany to Boston in $11\frac{1}{4}$ hours, and they start at the same time, in how many hours will they meet?

If A can go in $9\frac{1}{4}$ hrs., in 1 hour he can go $\frac{1}{9\frac{1}{4}} = \frac{4}{37}$ of the distance.

If B can go in $11\frac{1}{4}$ hrs., in 1 hour he can go $\frac{1}{11\frac{1}{4}} = \frac{4}{53}$ of the distance.

Both together can go $\frac{4}{37} + \frac{4}{53} = \frac{247}{1258}$ of the distance in 1 hour.

\therefore they will meet in $\frac{1258}{247}$ hrs. = $5\frac{23}{47}$ hrs.

25. A requires 4 days, B 3 days, and C $4\frac{1}{2}$ days, to do a certain piece of work. How long will it take all three working together?

If A can do it in 4 days, in one day he can do $\frac{1}{4}$ of it.

If B can do it in 3 days, in one day he can do $\frac{1}{3}$ of it.

If C can do it in $4\frac{1}{2}$ days, in one day he can do $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.

All together can do $\frac{1}{4} + \frac{1}{3} + \frac{2}{9} = \frac{22}{36}$ of it in one day.

\therefore it will take them, all working together, $\frac{36}{22}$ days = $1\frac{7}{11}$. Ans.

26. A can mow $\frac{5}{8}$ of a field in 3 days; B can mow $\frac{2}{3}$ of it in 4 days. How long will it take both to mow the field?

3 days $\div \frac{5}{8} = 5\frac{2}{5}$ days, and 4 days $\div \frac{2}{3} = 6$ days.

If A can mow it in $5\frac{2}{5}$ days, in one day he can mow $\frac{1}{5\frac{2}{5}} = \frac{5}{27}$ of it.

If B can mow it in 6 days, in one day he can mow $\frac{1}{6}$ of it.

Both together can mow $\frac{5}{27} + \frac{1}{6} = \frac{17}{54}$ of it in one day.

\therefore both together can mow it in $\frac{54}{17}$ days = $2\frac{10}{17}$ days. Ans.

27. One pipe can fill a cistern half full in $\frac{3}{4}$ of an hour, and another can fill it three-quarters full in $\frac{1}{2}$ an hour. How long will it take both pipes to fill the cistern?

$\frac{3}{4}$ hr. $\div \frac{1}{2} = 1\frac{1}{2}$ hrs., and $\frac{1}{2}$ hr. $\div \frac{3}{4} = \frac{2}{3}$ hr.

If one pipe fills it in $1\frac{1}{2}$ hrs., in one hour it will fill $\frac{1}{1\frac{1}{2}} = \frac{2}{3}$ of it.

If another pipe fills it in $\frac{2}{3}$ hr., in one hour it will fill $\frac{1}{\frac{2}{3}} = \frac{3}{2}$ of it.

Both together will fill $\frac{2}{3} + \frac{3}{2} = \frac{13}{6}$ of it in one hour.

\therefore both together will fill it in $6 \div 13 = \frac{6}{13}$ hr. Ans.

28. A cistern which holds 100 gallons can be filled from a pipe in 25 minutes, and emptied by a waste-pipe in 45 minutes. If both are opened together, how long will it take to fill the cistern, and how much water will be wasted?

The water-pipe fills $\frac{1}{25}$ every minute.

The waste-pipe empties $\frac{1}{45}$ every minute.

When both are open, $\frac{1}{25} - \frac{1}{45} = \frac{1}{112.5}$ is gained every minute.

\therefore the whole will be filled in $22\frac{1}{2} = 56\frac{1}{2}$ min. *Ans.*

If $\frac{1}{45}$ of the cistern is wasted every minute, in $56\frac{1}{2}$ minutes $56\frac{1}{2} \times \frac{1}{45}$ would be wasted.

Now, as the cistern holds 100 gals., the number of gallons wasted would be $56\frac{1}{2} \times \frac{1}{45} \times 100$ gals.

$$56\frac{1}{2} \times \frac{1}{45} \times 100 = \frac{225}{4} \times \frac{1}{45} \times \frac{100}{1} = 125 \text{ gals. } \textit{Ans.}$$

29. A pipe can fill a cistern one-third full in $\frac{1}{4}$ of an hour; a waste-pipe can empty $\frac{1}{4}$ of the cistern in 20 minutes. If both pipes are opened, in what time will the cistern be filled?

$\frac{1}{4}$ hr. $\times 3 = \frac{3}{4}$ hr. = 45 min., and 20 min. $\times 4 = 80$ min.

The water-pipe fills $\frac{1}{45}$ every minute.

The waste-pipe empties $\frac{1}{80}$ every minute.

When both are open, $\frac{1}{45} - \frac{1}{80} = \frac{7}{720}$ is gained every minute.

\therefore the whole will be filled in $102\frac{2}{3} = 102\frac{2}{3}$ min.

= 1 hr. 42 min. 51 $\frac{1}{3}$ sec. *Ans.*

30. If one pipe runs into a cistern at the rate of 2 gallons in 3 minutes, and another at the rate of 5 gallons in 4 minutes, while the water is running out of a third pipe at the rate of 4 gallons in 5 minutes, how long will it take to gain 71 gallons in the cistern?

2 gals. $\div 3 = \frac{2}{3}$ gals., 5 gals. $\div 4 = \frac{5}{4}$ gals., and 4 gals. $\div 5 = \frac{4}{5}$ gals.

If one pipe pours in $\frac{2}{3}$ gals. per minute, another pours in $\frac{5}{4}$ gals. per minute, and another empties $\frac{4}{5}$ gals. per minute, the cistern gains $\frac{2}{3} + \frac{5}{4} - \frac{4}{5} = \frac{67}{60}$ gals. per minute.

\therefore it will take as many minutes to gain 71 gals. as $71 \div \frac{67}{60} = 63\frac{27}{67}$ min. = 1 hr. 3 min. 34 $\frac{27}{67}$ sec.

31. A and B can do a piece of work in $2\frac{1}{2}$ days; A and C in $3\frac{1}{2}$ days; B and C in $4\frac{1}{2}$ days. Required the time in which all three, working together, can do the work, and in which each can do it alone.

If A and B can do it in $2\frac{1}{2}$ days, they can do $\frac{1}{2\frac{1}{2}} = \frac{2}{5}$ of it in one day.

If A and C can do it in $3\frac{1}{2}$ days, they can do $\frac{1}{3\frac{1}{2}} = \frac{2}{7}$ of it in one day.

If B and C can do it in $4\frac{1}{2}$ days, they can do $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it in one day.

All can do $\frac{2}{5} + \frac{2}{7} + \frac{2}{9} = \frac{152}{315}$ in 2 days, or $\frac{152}{630}$ of it in one day.

\therefore all can do it in $\frac{630}{152} = 2\frac{225}{38}$ days. *Ans.*

If A, B, and C can do $\frac{152}{315}$, and B and C $\frac{2}{9}$ of it in one day, A can do $\frac{152}{315} - \frac{2}{9} = \frac{72}{315}$ of it in one day.

\therefore A can do the whole in $\frac{315}{72} = 4\frac{5}{8}$ days. *Ans.*

If A, B, and C can do $\frac{152}{315}$, and A and C $\frac{2}{7}$ of it in one day, B can do $\frac{152}{315} - \frac{2}{7} = \frac{52}{315}$ of it in one day.

\therefore B can do the whole in $\frac{315}{52} = 5\frac{5}{52}$ days. *Ans.*

If A, B, and C can do $\frac{152}{315}$, and A and B $\frac{2}{5}$ of it in one day, C can do $\frac{152}{315} - \frac{2}{5} = \frac{28}{315}$ of it in one day.

\therefore C can do the whole in $\frac{315}{28} = 11\frac{3}{4}$ days. *Ans.*

32. Sampson & Reed sold $\frac{2}{3}$ of a lot of wheat to one party, $\frac{1}{3}$ of the remainder to another, and had 93 bushels left. How much had they at first?

After selling $\frac{2}{3}$ of the wheat they had $\frac{1}{3}$ left.

After selling $\frac{1}{3}$ of $\frac{1}{3}$ of the wheat they had $\frac{1}{3}$ of $\frac{1}{3} = \frac{1}{9}$ left.

Then 93 bush. = $\frac{1}{9}$ of the lot.

\therefore the whole lot = 93 bush. $\div \frac{1}{9} = 837$ bush. *Ans.*

33. In a certain school $\frac{2}{5}$ of the scholars are girls, $\frac{1}{5}$ of the boys are over 16 years old, and 6 boys are under 16. How many girls, and how many scholars in all?

After the girls, or $\frac{2}{5}$ of the school, are taken out, there remain $\frac{3}{5}$ of the school, or the boys.

After $\frac{1}{5}$ of $\frac{3}{5}$ are taken out, $\frac{2}{5}$ of $\frac{3}{5} = \frac{6}{25}$ are left.

\therefore the whole number of scholars is $6 \div \frac{6}{25} = 25$ scholars. *Ans.*

$\frac{2}{5}$ of 25 scholars = 10, number of girls. *Ans.*

34. In a certain school $\frac{1}{2}$ are boys; $\frac{1}{2}$ of the girls are under 16, and 13 girls are over 16. How many boys and how many girls is the school?

After the boys, or $\frac{1}{2}$ of the school, are taken out, there remains $\frac{1}{2}$ of the school, or the girls.

After $\frac{1}{2}$ of $\frac{1}{2}$ are taken out, $\frac{1}{2}$ of $\frac{1}{2} = \frac{1}{4}$ are left.

\therefore the whole number of scholars = $13 \div \frac{1}{4} = 48$ scholars.

$\frac{1}{2}$ of 48 = 22 girls. *Ans.* $\frac{1}{2}$ of 48 = 26 boys. *Ans.*

35. If from a certain number $\frac{1}{2}$ of it be subtracted, then $\frac{1}{3}$ of the remainder, then $\frac{1}{4}$ of that remainder, and 6 still remain, what is the number?

After $\frac{1}{2}$ of it is subtracted, $\frac{1}{2}$ is left.

After $\frac{1}{3}$ of $\frac{1}{2}$ is subtracted, $\frac{2}{3}$ of $\frac{1}{2} = \frac{1}{3}$ is left.

After $\frac{1}{4}$ of $\frac{1}{3}$ is subtracted, $\frac{3}{4}$ of $\frac{1}{3} = \frac{1}{4}$ is left.

\therefore the number = $6 \div \frac{1}{4} = 24$. *Ans.*

$\frac{1}{2}$ of $\frac{2}{3}$ of $\frac{2}{3} = \frac{1}{9}$. \therefore the number = $20 \div \frac{1}{9} = 180$. *Ans.*

37. 6 is $\frac{1}{2}$ of $\frac{1}{3}$ of $\frac{1}{4}$ of what number?

$\frac{1}{2}$ of $\frac{1}{3}$ of $\frac{1}{4} = \frac{1}{24}$. \therefore the number = $6 \div \frac{1}{24} = 144$. *Ans.*

$$\frac{7}{5} \text{ of } \frac{2}{3} = \frac{7}{15} \text{ of ship. } \frac{7}{15} \text{ of } \$45,000 = \$21,000, \text{ A's share.}$$

$$3\frac{3}{4} \text{ of } \frac{2}{3} \text{ of } \frac{7}{15} = \frac{1}{3} \text{ of ship. } \frac{1}{3} \text{ of } \$45,000 = \$15,000, \text{ B's share.}$$

and 12 horses can plow $12 \times \frac{1}{9}$ of 46 = $61\frac{1}{3}$ acres. *Ans.*

52. If 12 men can reap a field in 4 days, in what time will 32 men reap it?

Since 12 men can reap a field in 4 days,

Since 72 men can dig a trench in 63 days,

1 man can dig it in 72×63 days.

1 man can dig one 3 times as large in $3 \times 72 \times 63$ days,

and 42 men can dig it in $\frac{3 \times 72 \times 63}{42}$ days = 324 days. *Ans.*

54. If a man travels 540 miles in 24 days, walking 6 hours a day, how many miles can he travel in 3 days, walking 8 hours a day?

Since he can go 540 mi. in 24×6 hrs. = 144 hrs.,
 in one hour he can go $\frac{1}{144}$ of 540 mi.,

 it will take 4×15 men to do 4 times the work in 22 days,
 and to do 4 times the work in $\frac{1}{4}$ of 22 days it will take
 $5 \times 4 \times 15$ men = 300 men. *Ans.*

56. A garrison of 2100 has provisions for 9 months, but receives reinforcements of 600 men. How long will the provisions last?

Since the provisions will last 2100 men 9 months,
 they will last 1 man 2100×9 months,
 and they will last $2100 + 600 = 2700$ men
 $\frac{2100 \times 9}{2700}$ mos. = 7 mos. *Ans.*

72 people will eat twelve times as much as 6 people in the same time.

1404 bu. will last the same number of men four times as long as 351 bu.

And the same amount will last three times the number of men for 7 days as for 21 days.

$3 \times 4 \times 939$ soldiers = 11,268 soldiers. *Ans.*

7 men can mow 22 acres in 8 days of 11 hours = 88 hours,

1 man can mow 22 acres in 7×88 hours.

1 man can mow 1 acre in $\frac{7 \times 88}{22}$ hours.

12 men can mow 1 acre in $\frac{7 \times 88}{12 \times 22}$ hours.

12 men can mow 360 acres in $\frac{360 \times 7 \times 88}{12 \times 22}$ hours.

$$400 \text{ bbls. in } \frac{400 \times 44 \times 30 \times 3 \times 5}{5 \times 40 \times 300 \times 66} \text{ days} = 2 \text{ days. } Ans.$$

65. How many times will a wheel $2\frac{4}{7}$ feet in circumference turn round in travelling over $12\frac{6}{7}$ yards?

The wheel revolves once in going $2\frac{4}{7}$ feet.

\therefore it will turn around as many times in going $12\frac{6}{7}$ yds. = $38\frac{4}{7}$ ft.

as $38\frac{4}{7} \div 2\frac{4}{7} = 15$. *Ans.*

66. How much ground will be travelled over by a wheel $1\frac{3}{4}$ yards in circumference, when it has made $4\frac{1}{2}$ turns?

If the wheel turns once in going $1\frac{3}{4}$ yds., in making $4\frac{1}{2}$ turns it will go $4\frac{1}{2}$ times $1\frac{3}{4}$ yds. = $6\frac{3}{4}$ yds. *Ans.*

67. Find the circumference of a wheel which makes 9 turns in travelling over $7\frac{1}{2}$ yards.

If it makes 9 turns in going $7\frac{1}{2}$ yds., it will go $7\frac{1}{2}$ yds. $\div 9 = \frac{4}{3}$ yd. = $2\frac{2}{3}$ ft. in making one turn.

\therefore the circumference of the wheel is $2\frac{2}{3}$ feet. *Ans.*

68. If the circumference of a wheel be $2\frac{2}{7}$ of 1 yd. $1\frac{1}{3}$ ft., how many times will it turn in travelling $3\frac{3}{7}$ miles?

$$1 \text{ yd. } 1\frac{1}{3} \text{ ft.} = 1\frac{1\frac{1}{3}}{3} \text{ yds.} = 1\frac{2}{3} \text{ yds.} \quad 3\frac{3}{7} \text{ mi.} = 3\frac{3}{7} \times 1760 \text{ yds.}$$

If the wheel makes 1 turn in going $2\frac{2}{7}$ of $1\frac{2}{3}$ yds., it will make as many turns in going $3\frac{3}{7} \times 1760$ yds. as $\frac{3\frac{3}{7} \times 1760}{2\frac{2}{7} \times 1\frac{2}{3}} = 1396\frac{4}{11}$. *Ans.*

69. If the wheel of a locomotive be $3\frac{1}{2}$ times 5.52 feet in circumference, how many times does it turn in a minute, when the locomotive is running at the rate of 13.34 miles an hour?

$$5.52 = 5\frac{1}{2}, \text{ and } 13.34 = 13\frac{1}{2}.$$

If it is going at the rate of $13\frac{1}{2}$ miles per hour, it is going at the rate of $\frac{13\frac{1}{2}}{60}$ miles per minute, or at the rate of $\frac{13\frac{1}{2} \times 5280}{60}$ feet per minute.

If it turns once in going $3\frac{1}{2} \times 5\frac{1}{2}$ feet, it will turn as many times in going $\frac{13\frac{1}{2} \times 5280}{60}$ feet as $\frac{13\frac{1}{2} \times 5280}{60} \div (3\frac{1}{2} \times 5\frac{1}{2}) = 67\frac{1}{2}$.

Ans.

70. A can run $\frac{4}{5}$ of a mile in $\frac{1}{2}$ of a minute, B can run $\frac{5}{8}$ of a mile in $\frac{1}{3}$ of a minute, and C $\frac{3}{4}$ of a mile in $\frac{1}{4}$ of a minute. Which is the fastest runner? and if he can run a certain distance in 3 min. 10 sec, how much longer will each of the others take to run the same distance?

If A can run $\frac{4}{5}$ mi. in $\frac{1}{2}$ min., to run a mile it will take him $\frac{1}{2}$ min. $\div \frac{4}{5} = 8\frac{1}{4}$ min.

If B can run $\frac{5}{8}$ mi. in $\frac{1}{3}$ min., to run a mile it will take him $\frac{1}{3}$ min. $\div \frac{5}{8} = 7\frac{2}{3}$ min.

If C can run $\frac{3}{4}$ mi. in $\frac{1}{4}$ min., to run a mile it will take him $\frac{1}{4}$ min. $\div \frac{3}{4} = 2\frac{1}{3}$ min.

fastest runner.

$$\therefore = 3\frac{1}{2} \text{ min.}$$

a certain distance in $3\frac{1}{2}$ min., and a mile in $6\frac{1}{2}$ min. distance is that part of a mile which $3\frac{1}{2}$ is of $6\frac{1}{2} - \frac{1}{2}$.

∴ a mile in $8\frac{1}{4}$ min., he can run $\frac{1}{2}$ mi. in $\frac{1}{2}$ of $8\frac{1}{4}$ min. = 3 min. 51 sec.

∴ it in 3 min 10 sec. ∴ it takes A 41 sec. longer than C.

a mile in $7\frac{2}{3}$ min., he can run $\frac{1}{3}$ mi. in $\frac{1}{3}$ of $7\frac{2}{3}$ min. = 3 min. 29 $\frac{1}{3}$ sec.

∴ it in 3 min. 10 sec. ∴ it takes B 19 $\frac{1}{3}$ sec. longer

d the cost of:

- Nine joists, each 15 ft. long, $3\frac{1}{2}$ in. by 5 in., at \$12 per M.

$$5 \text{ in.} = \frac{1}{2} \text{ ft.} \quad \$12 \text{ per M.} = \frac{\$12}{1000} \text{ per sq. ft.}$$

Hence 1 joist = $3\frac{1}{2}$ boards 15 ft. by $\frac{1}{2}$ ft.

$$15 \times \frac{7}{2} \times \frac{5}{12} \times 9 \times \frac{\$12}{1000} = \frac{\$169}{80} = \$2.36. \textit{ Ans.}$$

48. Thirty planks, each 12 ft. long, 11 in. wide, 3 in. thick, at \$15 per M.

$$11 \text{ in.} = \frac{11}{12} \text{ ft.} \quad \$15 \text{ per M.} = \frac{\$15}{1000} \text{ per sq. ft.}$$

Hence 1 plank = 3 boards 12 ft. by $\frac{11}{12}$ ft.

$$12 \times \frac{11}{12} \times 3 \times 30 \times \frac{\$15}{1000} = \frac{\$297}{20} = \$14.85. \text{ Ans.}$$

49. Four sticks of timber, each 8 in. by 9 in. and 23 ft. long, at \$18 per M.

$$9 \text{ in.} = \frac{3}{4} \text{ ft.} \quad \$18 \text{ per M.} = \frac{\$18}{1000} \text{ per sq. ft.}$$

Hence 1 stick = 8 boards 23 ft. by $\frac{3}{4}$ ft.

$$\frac{23}{1} \times \frac{3}{4} \times \frac{8}{1} \times \frac{4}{1} \times \frac{\$18}{1000} = \frac{\$1242}{125} = \$9.94. \text{ Ans.}$$

50. A board 24 ft. long, 23 in. wide at one end and 17 in. at the other, and $1\frac{1}{2}$ in. thick, at \$30 per M.

$$\frac{23 + 17}{2} = 20 \text{ in. average width.}$$

$$20 \text{ in.} = 1\frac{2}{3} \text{ ft.}$$

$$\$30 \text{ per M.} = \frac{\$30}{1000} \text{ per sq. ft.}$$

Hence the board = $1\frac{2}{3}$ boards 24 ft. by $1\frac{2}{3}$ ft.

$$24 \times \frac{5}{3} \times \frac{3}{2} \times \frac{\$30}{1000} = \frac{\$9}{5} = \$1.80. \text{ Ans.}$$

51. A stick of timber 29 ft. long, 10 in. by 12 in. at \$13.50 per M.

$$12 \text{ in.} = 1 \text{ ft.} \quad \$13.50 \text{ per M.} = \frac{\$13\frac{1}{2}}{1000} = \frac{\$27}{2000} \text{ per ft.}$$

Hence 1 stick = 10 boards 29 ft. by 1 ft.

$$29 \times 10 \times 1 \times \frac{\$27}{2000} = \frac{\$783}{200} = \$3.92. \text{ Ans.}$$

52. The flooring for two floors, each 23 ft. by 17 ft., each floor double, and of boards $\frac{7}{8}$ in. thick; the lower floor at \$18, and the upper at \$24, per M.

Boards $\frac{1}{2}$ in. thick are reckoned as 1 in.

Hence each floor, being double, will require $2 \times 23 \times 17 = 782$ sq. ft.

Average cost per floor = \$21 per M.

\therefore Average cost both floors = \$42 per M.

\therefore Whole cost = $782 \times \frac{\$42}{1000} = \32.84 . *Ans.*

53. The flooring timbers for a room 23 ft. by 17 ft. at \$18 per M, if they are 2 in. by 10 in., 17 ft. long, and are placed on edge, two close to the walls, and the others with spaces of $\frac{1}{8}$ of a foot between them.

The room being 17 ft. wide and the timbers 17 ft. long, the timbers must run across the room. After a timber is placed against the wall at one end, the remaining distance to be occupied with timbers and spaces = 23 ft. - 2 in. = $22\frac{1}{2}$ ft. The distance occupied by a timber and a space = $\frac{1}{8} + \frac{10}{12} = \frac{137}{120}$ ft.

$\therefore 22\frac{1}{2} \div \frac{137}{120} =$ number of timbers required for remaining space.

$$22\frac{1}{2} + \frac{137}{120} = \frac{137}{8} \times \frac{20}{137} = 20.$$

1 timber is supposed to have been placed.

$\therefore 20 + 1 = 21$, the whole number of timbers required.

$$19 \times \frac{1}{8} \times 17 \times \frac{\$18}{1000} = \frac{\$51}{100} = \$0.51, \text{ cost of one timber.}$$

$\therefore 21 \times \$0.51 = \10.71 , whole cost. .

$$\begin{array}{r} 15 \\ 30 \\ \hline 106 \end{array} \times \frac{5}{100} \times \frac{\$13250}{100} = \$37.50. (1)$$

$$\begin{array}{r} 7 \\ 28 \\ \hline 106 \end{array} \times \frac{5}{100} \times \frac{\$13250}{100} = \$35. (3)$$

7. A certain business with a capital of \$25000 on the 19th of March and on the 17th of next month B was a partner with a capital of \$1000. On Dec. 31 the profits are \$450. What is the share of each?

From March 19 to Dec. 31 = 284 days.

From July 17 to Dec. 31 = 154 days.

$$25000 \div 284 = 8802.29$$

$$1000 \div 154 = 649.35$$

$$\frac{8802.29}{649.35}$$

$$\frac{8802.29}{284} \times \frac{154}{1} = \$1356.35$$

$$\frac{649.35}{154} \times \frac{154}{1} = \$1000.00$$

8. A and B join business in the ratio 7:11. At the end of 7 months A withdraws $\frac{1}{2}$ of his and B $\frac{1}{3}$ of his; and after 11 months more they divide a profit of \$5148.50. What is the share of each?

$$7 \div 7 = 1$$

$$11 \div \frac{1}{2} = 22$$

$$\frac{22}{1} = 22$$

$$7 \div 11 = 1$$

$$11 \div \frac{1}{3} = 33$$

$$\frac{33}{1} = 33$$

$$22 - 33 = 11$$

$$\frac{5148.50}{11} \times \frac{11}{1} = \$4680.45$$

$$4680.45 - \$1356.35 = \$3324.10$$

EXERCISE LXVII.

1. The population of a town in 1870 was 12,275, and it increased 8% in the next ten years. Find its population in 1880.

If 100 represent the population in 1870, then 108 will represent the population in 1880.

$$\frac{27}{108} \text{ of } \frac{491}{12275} = 13,257. \text{ Ans.}$$

2. How much metal will be obtained from 365 tons of ore, if the metal be 7% of the ore?

If 100 represent the ore, then 7 will represent the metal in the ore.

$$\frac{7}{100} \text{ of } \frac{365}{1} = \frac{511}{20} = 25.55 \text{ tons. Ans.}$$

3. If gunpowder contains 75% of saltpetre, 10% of sulphur, 15% of charcoal, how much of each is there in a ton of gunpowder?

If 100 represent the gunpowder, then 75, 10, and 15 will represent respectively the saltpetre, sulphur, and charcoal.

$$\frac{75}{100} \times \frac{2000}{1} = 1500 \text{ lbs. saltpetre.}$$

$$\frac{10}{100} \times \frac{2000}{1} = 200 \text{ lbs. sulphur.}$$

$$\frac{15}{100} \times \frac{2000}{1} = 300 \text{ lbs. charcoal.}$$

4. A manufactory uses 24 tons of coal a day, and 20% of it is lost in smoke. How much coal would be needed if this waste could be prevented?

If 100 represent the number of tons of coal used, then 20 will be the number of tons lost in smoke.

$$\frac{24}{5} = 4.8 \text{ t. } 24 \text{ t.} - 4.8 \text{ t.} = 19.2 \text{ t. Ans.}$$

5. Air contains 20.0265% (by measure) of oxygen gas and nitrogen. How much oxygen in 1750 cu. ft. of air?

If 100 represent the number of cubic feet of air, then 20.0265 will represent the number of cubic feet of oxygen.

$$\frac{20.0265}{100} \times \frac{1750}{1} = 350.46 \text{ cu. ft. Ans.}$$

6. A town, after decreasing 25 %, has 4539 inhabitants. Find its number at first.

If 100 represent the population at first, then 75 will represent the population now.

$$\frac{4}{100} \times \frac{1513}{1} = 6052. \text{ Ans.}$$

7. 2 % of a regiment of 750 men are killed in an engagement, 6 % are wounded, and 4 % are missing. What is the number still available for service?

If 100 represent the number of men in the regiment then 2, 6, and 4 will represent the number, killed, wounded, and missing.

$$\begin{array}{l} 2 + 4 + 6 = 12 \\ 100 - 12 = 88 \end{array} \quad \frac{22}{88} \times \frac{30}{750} = 660 \text{ men. Ans.}$$

8. If $3\frac{3}{4}$ tons of sulphur are required to make $31\frac{1}{4}$ tons of gunpowder, what is the per cent of sulphur in gunpowder?

If 100 represent the whole weight, then the number required to represent $3\frac{3}{4}$ tons of sulphur will be $\frac{3\frac{3}{4}}{31\frac{1}{4}}$ of 100 = 12.

That is, 12 %. Ans.

9. In a school of 80 children, $17\frac{1}{2}$ % are girls. Find the number of boys.

If 100 represent the number of scholars in the school, then $100 - 17\frac{1}{2}$, or $82\frac{1}{2}$, will represent the number of boys in the school.

$$\frac{82\frac{1}{2}}{100} \text{ of } 80 = \frac{33}{2} \times \frac{1}{100} \times \frac{2}{1} = 66 \text{ boys. Ans.}$$

10. If goods are bought for \$415, and sold for \$500, what is the gain per cent?

$$\$500 - \$415 = \$85, \text{ actual gain.}$$

Since the gain on \$415 is \$85, the gain on 100 is

$$\frac{100}{415} \text{ of } \frac{85}{1} = 20\frac{17}{83}\% \therefore \text{the gain is } 20\frac{17}{83}\% \text{ Ans.}$$

11. If goods are bought for \$415, and sold for \$400, what is the loss per cent?

\$415 - \$400 = \$15, actual loss.

Since the loss on \$415 is \$15, the loss on 100 is

$$\frac{100}{415} \text{ of } \frac{15}{1} = 3\frac{3}{83}\% \therefore \text{the loss is } 3\frac{3}{83}\% \text{ Ans.}$$

12. \$500 is 4% of what number?

If 4 represent \$500, 100 will represent $\frac{100}{4}$ of \$500 = \$12,500.

13. A farmer buys 24 head of cattle at \$80 a head, and, after losing 6, sells the remainder at \$105 a head. How much does he gain or lose per cent?

24 head of cattle at \$80 per head cost \$1920.

18 head of cattle at \$105 per head cost \$1890.

\$1920 - \$1890 = \$30, actual loss.

Since the loss on \$1920 is \$30, the loss on 100 is

$$\frac{100}{1920} \text{ of } \frac{30}{1} = 1\frac{25}{16}\% \therefore \text{he loses } 1\frac{25}{16}\% \text{ Ans.}$$

14. If a ton (2240 lbs.) of ore in a gold mine yield 5 oz. (troy) of gold, what is the yield per cent?

5 oz. troy = $\frac{5}{12}$ lbs. troy = $\frac{5}{12}$ of $\frac{12}{1}$ lbs. av. = $\frac{5}{12}$ lb. av.

If 100 be taken to represent the ore, the number required to represent the metal will be

$$\frac{\frac{5}{12}}{2240} \text{ of } 100 = \frac{1}{2240} \times \frac{12}{25} \times \frac{100}{1} = \frac{3}{196} \text{ That is, } \frac{3}{196} \text{ of } 1\% \text{ Ans.}$$

15. If the ore in a mine yields $\frac{3}{80}$ of 1% of pure gold, how many tons (2240 lbs.) of ore must be taken to obtain 7 lbs. (troy) of gold?

$$7 \text{ lbs. troy} = 7 \times \frac{5760}{1000} \text{ lbs. av.} = 5\frac{1}{2}\frac{2}{3} \text{ lbs. av.}$$

If 100 be taken to represent the ore, $\frac{3}{80}$ will represent the gold in the ore. If $\frac{3}{80}$ represent $5\frac{1}{2}\frac{2}{3}$ lbs., 100 will represent

$$\left(\frac{100}{\frac{3}{80}} \text{ of } 5\frac{1}{2}\frac{2}{3}\right) \text{ lbs. or } \frac{\frac{100}{\frac{3}{80}} \text{ of } 5\frac{1}{2}\frac{2}{3}}{2240} \text{ tons} = \frac{4}{1} \times \frac{30}{3} \times \frac{48}{25} \times \frac{1}{2240} \times \frac{28}{7} = 4\frac{2}{7} = 6\frac{2}{7} \text{ t. Ans.}$$

16. $12\frac{1}{2}$ tons of iron are obtained from 235 tons of ore. What per cent of the ore is iron?

If 100 be taken to represent the whole weight of the ore, the number required to represent $12\frac{1}{2}$ tons will be

$$\frac{12\frac{1}{2}}{235} \text{ of } 100 = \frac{25}{235} \times \frac{1}{\frac{47}{50}} \times \frac{100}{1} = 5\frac{1}{4}\frac{5}{7}\%. \text{ That is, } 5\frac{1}{4}\frac{5}{7}\% \text{ Ans.}$$

17. Goods are sold, at a loss of 3%, for \$2667.50. What was the cost?

If 100 be taken to represent the cost, $100 - 3 = 97$ will represent the selling price. Therefore the selling price was $\frac{100}{97}$ of \$2667.50 = \$2750. *Ans.*

18. Teas at 68 cents, 86 cents, and 96 cents a pound, are mixed in equal quantities, and sold at 90 cents a pound. Find the gain per cent.

$$\frac{68 + 86 + 96}{3} = 83\frac{1}{3} \text{ cost per lb. } 90 - 83\frac{1}{3} = 6\frac{2}{3}, \text{ actual gain.}$$

Since the gain on $83\frac{1}{3}$ cents is $6\frac{2}{3}$ cents, the gain on 100 is $\frac{100}{83\frac{1}{3}}$ of $6\frac{2}{3} = 8$. That is, 8%. *Ans.*

19. By selling goods for \$1173.92, a merchant gains \$153.12. Find the gain per cent on the cost.

$$\$1173.92 - \$153.12 = \$1020.80, \text{ cost.}$$

Since the gain on \$1020.80 is \$153.12, the gain on 100 is

$$\frac{100}{1020.80} \text{ of } 153.12 = 15. \text{ That is, } 15\% \text{ Ans.}$$

20. If to 25 gals. of alcohol 2 gals. of water are added, how much per cent of the mixture is water? how much per cent is alcohol?

$25 + 2 = 27$ gals., the whole amount.

If 100 be taken to represent the whole amount, the number required to represent 2 gals. will be $\frac{2}{27}$ of 100 = $7\frac{1}{3}\%$. That is, $7\frac{1}{3}\%$ water. *Ans.*

$100 - 7\frac{1}{3}\% = 92\frac{2}{3}\%$ alcohol. *Ans.*

21. What was the cost when $17\frac{1}{2}\%$ was gained by selling goods for \$253.80?

If 100 be taken to represent the cost, $100 + 17\frac{1}{2} = 117\frac{1}{2}$ will represent the selling price.

Therefore, the cost was $\frac{100}{117\frac{1}{2}}$ of \$253.80 = \$216. *Ans.*

22. A wine merchant mixes 24 gallons, at \$7 a gallon, with 18 gallons, at \$5 a gallon, and sells the whole at \$7 a gallon. What does he gain per cent?

$24 \times \$7 + 18 \times \$5 = \$168 + \$90 = \$258$, cost.

$24 + 18 = 42$, whole number of gallons.

$42 \times \$7 = \294 , selling price.

$\$294 - \$258 = \$36$, actual gain.

Since the gain on \$258 is \$36, the gain on 100 is $\frac{36}{258}$ of 100 = $13\frac{1}{3}\%$.

That is, $13\frac{1}{3}\%$. *Ans.*

23. By selling a horse for \$200, a dealer loses $12\frac{1}{2}\%$. What would he have gained or lost per cent by selling at \$250?

If 100 be taken to represent the selling price, $100 - 12\frac{1}{2} = 87\frac{1}{2}$ will represent the cost.

Therefore the cost was $\frac{100}{87\frac{1}{2}}$ of \$200 = \$228 $\frac{4}{7}$.

$\$250 - \$228\frac{4}{7} = \$21\frac{3}{7}$, gain by selling at \$250.

Since the gain on \$228 $\frac{4}{7}$ would have been \$21 $\frac{3}{7}$, the gain on 100

would have been $\frac{100}{228\frac{4}{7}}$ of 21 $\frac{3}{7}$ = $9\frac{3}{7}\%$. That is, $9\frac{3}{7}\%$ gain. *Ans.*

24. A spirit merchant buys 75 gals., at \$3.25 a gallon, and, after drawing off 10 gals., sells the remainder so as to gain 5% on the whole. What is the selling price per gallon?

$$75 \times \$3.25 = \$243.75, \text{ cost.}$$

If 100 be taken to represent the cost, $100 + 5 = 105$ will represent the selling price.

Therefore, the selling price is $\frac{105}{100}$ of \$243.75 = \$255.93 $\frac{3}{4}$.

75 gals. — 10 gals. = 65 gals., number sold.

$$\frac{\$255.93\frac{3}{4}}{65} = \$3.93\frac{3}{4}, \text{ selling price per gallon. } \textit{Ans.}$$

25. A person owns two estates worth respectively \$9845 and \$12,155. If the first rise in value 32%, and the second fall 13%, determine the rise or fall per cent in the value of his whole property.

If 100 be taken to represent the value of the first estate at first, $100 + 32 = 132$ will represent its value after rising 32%.

Therefore, the value after rising is $\frac{132}{100}$ of \$9845 = \$12,995.40.

If 100 be taken to represent the value of the second estate at first, $100 - 13 = 87$ will represent its value after falling 13%.

Therefore, the value after falling is $\frac{87}{100}$ of \$12,155 = \$10,574.85.

\$9845 + \$12,155 = \$22,000, value of the estates at first.

\$12,995.40 + \$10,574.85 = \$23,570.25, value afterwards.

\$23,570.25 — \$22,000 = \$1570.25, actual gain.

Since the gain on \$22,000 is \$1570.25, the gain on 100 is $\frac{1570.25}{22000}$ of \$1570.25 = $7\frac{1}{8}\%$. That is, $7\frac{1}{8}\%$ gain. *Ans.*

26. A tradesman marks an article \$5, but takes off 5% for cash. If his profit is 14%, what was the cost of the article?

If 100 be taken to represent the marked price, $100 - 5 = 95$ will represent the actual price.

Therefore, the actual price was $\frac{95}{100}$ of \$5 = \$4.75.

If 100 be taken to represent the cost, $100 + 14 = 114$ will represent the price.

Therefore, the cost was $\frac{100}{114}$ of \$4.75 = \$4.16 $\frac{2}{3}$. *Ans.*

27. What would a dishonest dealer gain per cent by using a false weight of 15 oz. instead of a pound?

16 oz. — 15 oz. = 1 oz., actual gain.

Since the gain on 15 oz. is 1 oz., the gain on 100 is $\frac{1}{15}$ of 100 = $6\frac{2}{3}\%$.

That is, $6\frac{2}{3}\%$. *Ans.*

28. A dishonest dealer gains 12% by using false weights. What is the real weight of his pound?

If 100 be taken to represent the false weight of a pound,
 $100 + 12 = 112$ will represent the true weight of a pound.
 Therefore, the false weight is $\frac{100}{112}$ of 16 oz. = $14\frac{2}{3}$ oz. *Ans.*

29. A tradesman, in selling goods, deducts from the marked price 5% for cash. What is the marked price of some goods for which he receives \$7.12 $\frac{1}{2}$?

If 100 be taken to represent the marked price, $100 - 5 = 95$ will represent the actual price.

Therefore, the marked price is $\frac{100}{95}$ of \$7.12 $\frac{1}{2}$ = \$7.50. *Ans.*

30. The lead ore from a certain mine yields 60% of metal, and of the metal $\frac{2}{3}$ of 1% is silver. How much silver and lead will be obtained from 1200 tons of ore?

If 100 be taken to represent the ore, 60 will represent the metal.
 Therefore, the amount of metal is $\frac{60}{100}$ of 1200 t. = 720 t.

If 100 be taken to represent the metal, $\frac{2}{3}$ will represent the silver.

Therefore, the amount of silver is $\frac{\frac{2}{3}}{100}$ of 720 = 5.4 t. *Ans.*

720 t. - 5.4 t. = 714.6 t., lead. *Ans.*

31. If ore loses 41 $\frac{1}{2}$ % of its weight in roasting, and 43 $\frac{1}{4}$ % of the remainder in smelting, how much ore will be required to yield 1000 tons of metal?

If 100 be taken to represent the ore, $100 - 41\frac{1}{2} = 58\frac{1}{2}$ will represent the ore after roasting.

$58\frac{1}{2}$ represent the ore after roasting, $58\frac{1}{2} - 43\frac{1}{4}\%$ of $58\frac{1}{2} = 32\frac{1}{4}$ will represent the ore after smelting.

Therefore, $\frac{32\frac{1}{4}}{100}$ t. will be the amount of metal in 1 ton of ore,

and $\frac{1000}{\frac{32\frac{1}{4}}{100}}$ t. = 3038.938 t. will be the amount of ore required to

make 1000 tons of metal. *Ans.*

32. How many per cent above cost must a man mark his goods in order to take off 10%, and still make a profit of 17%?

If 100 be taken to represent the cost, the selling price will be represented by 117.

As the selling price is to be 10% below the marked price, the selling price (117) will be $\frac{90}{100}$ of the marked price.

Therefore, the marked price will be $\frac{100}{90}$ of 117 = 130.

That is, the goods must be marked 30% above cost. *Ans.*

33. How many per cent above cost must a man mark his goods in order to take off $12\frac{1}{2}\%$, and still make a profit of $12\frac{1}{2}\%$?

If 100 be taken to represent the cost, the selling price will be represented by 112 $\frac{1}{2}$.

As the selling price is to be $12\frac{1}{2}\%$ below the marked price, the selling price (112 $\frac{1}{2}$) will be $\frac{87\frac{1}{2}}{100}$ of the marked price.

Therefore, the marked price will be $\frac{100}{87\frac{1}{2}}$ of 112 $\frac{1}{2}$ = 128 $\frac{4}{5}$.

That is, the goods must be marked 28 $\frac{4}{5}\%$ above cost. *Ans.*

34. How many per cent above cost must a man mark his goods in order to take off 15%, and still make a profit of 15%?

If 100 be taken to represent the cost, the selling price will be represented by 115.

As the selling price is to be 15% below the marked price, the selling price (115) will be $\frac{85}{100}$ of the marked price.

Therefore, the marked price will be $\frac{100}{85}$ of 115 = 135 $\frac{5}{7}$.

That is, the goods must be marked 35 $\frac{5}{7}\%$ above cost. *Ans.*

35. How many per cent above cost must a man mark his goods in order to take off 33 $\frac{1}{3}\%$, and still make a profit of 33 $\frac{1}{3}\%$?

If 100 be taken to represent the cost, the selling price will be represented by 133 $\frac{1}{3}$.

As the selling price is to be 33 $\frac{1}{3}\%$ below the marked price, the selling price (133 $\frac{1}{3}$) will be $\frac{66\frac{2}{3}}{100}$ of the marked price.

Therefore, the marked price will be $\frac{100}{66\frac{2}{3}}$ of 133 $\frac{1}{3}$ = 200.

That is, the goods must be marked 100% above cost. *Ans.*

36. If 5% of the population of a town has been the increase in the preceding ten years, what per cent of the population ten years ago has been added?

If 100 be taken to represent the population, the population 10 years ago will be represented by 95.

Since the gain on 95 is 5, the gain on 100 is $\frac{100}{95}$ of 5 = $5\frac{1}{19}$.

That is, $5\frac{1}{19}\%$. *Ans.*

37. If, in a population of 27,000,000, 13% are foreign-born, how many foreign-born are there? What is the ratio of the foreign-born to the native?

If 100 be taken to represent the population, 13 will represent the foreign-born population.

Therefore, the foreign-born population is $\frac{13}{100}$ of

$27,000,000 = 3,510,000$ (1). $13\% : 87\% = 13 : 87$. (2) *Ans.*

38. A man bought a horse for \$70, and sold him for \$80. What per cent did he gain? What per cent of the money received for the horse was gained?

$\$80 - \$70 = \$10$ actual gain.

Since the gain on \$70 is \$10, the gain on 100 is $\frac{10}{70}$ of 100 = $14\frac{2}{7}$.

That is, $14\frac{2}{7}\%$. (1) *Ans.*

Since the gain on \$80 is \$10, the gain on 100 is $\frac{10}{80}$ of 100 = $12\frac{1}{2}$.

That is, $12\frac{1}{2}\%$. (2) *Ans.*

39. If, by selling goods for $12\frac{1}{2}$ per cent profit, a merchant clears \$800, what was the cost of the goods, and for how much were they sold?

If $12\frac{1}{2}$ represent \$800, 100 will represent $\frac{100}{12\frac{1}{2}}$ of \$800 = \$6400.

cost. $\$6400 + \$800 = \$7200$, selling price. *Ans.*

A man selling eggs at 40 cents a dozen clears $33\frac{1}{3}\%$ on the what was the cost? Another, selling at the same price, clears, of his receipts; what did his eggs cost?

If 100 be taken to represent the cost, $133\frac{1}{3}$ will represent the selling price.

Therefore the cost was $\frac{100}{133\frac{1}{3}}$ of 40 cents = 30 cents. (1) *Ans.*

If 100 be taken to represent the selling price, $66\frac{2}{3}$ will represent the cost.

Therefore, the cost was $\frac{66\frac{2}{3}}{100}$ of 40 cents = $26\frac{2}{3}$ cents. (2) *Ans.*

41. By selling a carriage for \$117, a carriage-maker lost 10% of the cost. What ought he to have sold it for to make 10%?

If 100 be taken to represent the cost, 90 will represent the selling price.

Therefore, the cost was $\frac{100}{90}$ of \$117 = \$130.

If 100 be taken to represent the cost, 110 will represent the price at which he ought to have sold it.

Therefore, the selling price ought to have been $\frac{110}{100}$ of \$130 = \$143.

42. A man gained in January 3% in weight, and in February lost 3%. What per cent of his weight on the first day of January is his weight on the first day of March?

If 100 be taken to represent his weight Jan. 1, 103 will represent it Feb. 1.

If 100 be taken to represent his weight Feb. 1, 97 will represent it March 1.

Therefore, his weight March 1 was $\frac{97}{100}$ of 103 = $99\frac{91}{100}$.

$99\frac{91}{100}$ is $99\frac{91}{100}\%$ of 100. *Ans.*

43. 7 lbs. of a certain article lose 3 oz. in weight by drying. What per cent of the original weight is water?

7 lbs. = 112 oz.

If 100 be taken to represent the whole weight, the number required to represent 3 oz. is $\frac{3}{11\frac{1}{2}}$ of 100 = $2\frac{1}{2}\%$.

That is, $2\frac{1}{2}\%$. *Ans.*

44. 7 lbs. of a dry article have lost 3 oz. by drying. What per cent of the original weight was water?

7 lbs. = 112 oz. 112 oz. + 3 oz. = 115 oz., whole weight.

If 100 be taken to represent the whole weight, the number required to represent 3 oz. is $\frac{3}{11\frac{1}{2}}$ of 100 = $2\frac{1}{2}\%$.

That is, $2\frac{1}{2}\%$. *Ans.*

45. A dry article was exposed to damp air, and absorbed 3 oz. of water; it then weighed 7 lbs. What per cent of its present weight is water?

7 lbs. = 112 oz.

If 100 be taken to represent the whole weight, the number required to represent 3 oz. is $\frac{3}{112}$ of 100 = $2\frac{1}{8}\%$.

That is, $2\frac{1}{8}\%$. *Ans.*

46. If rosin is melted with 20% of its weight of tallow, what per cent of tallow does the mixture contain?

If 100 be taken to represent the rosin, 120 will represent the mixture.

Therefore, the tallow will be represented by $\frac{20}{120}$ of 100 = $16\frac{2}{3}\%$.

That is, $16\frac{2}{3}\%$. *Ans.*

47. If 20% of a mixture of tallow and rosin is tallow, what per cent of the weight of the rosin is the weight of the tallow?

If 100 be taken to represent the mixture, $100 - 20 = 80$ will represent the rosin.

If 80 is 100%, 20 is $\frac{2}{8}$ of 100% = 25%. *Ans.*

48. How many pounds of tallow must be mixed with $8\frac{1}{2}$ lbs. of rosin in order that the mixture may contain 15% of tallow?

If 100 be taken to represent the mixture, $100 - 15 = 85$ will represent the rosin.

If 85 represent $8\frac{1}{2}$ lbs., 15 will represent $\frac{15}{85}$ of $8\frac{1}{2}$ lbs. = $1\frac{1}{2}$ lb.

49. Nitrogen gas, under standard pressure and temperature, is $\frac{1}{100}$ of 1% of the weight of an equal volume of water. What is its specific gravity?

If 100 be taken to represent the water, $\frac{1}{100}$ will represent nitrogen.

Therefore, the specific gravity of nitrogen is $\frac{\frac{1}{100}}{100} = 0.00125$. *Ans.*

50. Oxygen gas is $\frac{1}{8}$ of 1% of the weight of an equal volume of water; what is its specific gravity? How many gallons of oxygen will it take to weigh as much as a pint of water? How many of nitrogen?

If 100 be taken to represent water, $\frac{1}{7}$ will represent oxygen.

Therefore, the specific gravity of oxygen is $\frac{\frac{1}{7}}{100} = \frac{1}{700}$. (1) *Ans.*

As 1 gal. of oxygen weighs $\frac{1}{700}$ of a gallon of water, it will take as many gallons of oxygen to weigh as much as a pint of water as $\frac{\frac{1}{2}}{\frac{1}{700}} = 87\frac{1}{2}$ gals. (2) *Ans.*

As 1 gal. of nitrogen weighs 0.00125 of a gallon of water, it will take as many gallons of nitrogen to weigh as much as a pint of water as $\frac{\frac{1}{2}}{0.00125} = 100$ gals. (3) *Ans.*

51. If common air consist of 4 volumes of oxygen to 13 of nitrogen, what is its specific gravity?

4 volumes of oxygen = $4 \times \frac{1}{700} = \frac{4}{700}$.

13 volumes of nitrogen = $13 \times \frac{1}{800} = \frac{13}{800}$.

$\frac{4}{700} + \frac{13}{800} = \frac{123}{8000}$, for 17 volumes.

Therefore, the specific gravity is $\frac{123}{8000} + 17 = 0.00129$. *Ans.*

52. How many gallons of air weigh as much as a pint of water?

As 1 gallon of air weighs 0.00129 of a gallon of water, it will take as many gallons of air to weigh as much as a pint of water as $\frac{\frac{1}{2}}{0.00129} = 96\frac{1}{2}$ gals. *Ans.*

53. If by heating iron 185° F. it expands $\frac{1}{8}$ of 1%, what will be the expansion of iron in passing from -20° F. to +120° F.?

The difference between -20° and +120° is 140°.

If $\frac{1}{8}$ of 1% is the expansion for 185°, the expansion for 140° is $\frac{140}{185}$ of $\frac{1}{8}$ of 1% = $\frac{7}{74}$ of 1%. *Ans.*

54. A tubular iron bridge is 450 ft. long, and one end is fast to a pier. How much play must be allowed at the other end, if the iron expands at the above rate, and if the climate varies from -30° F. in winter to +130° F. in a July sun?

The difference between -30° and +130° is 160°.

If $\frac{1}{8}$ of 1% is the expansion for 185°, the expansion for 160° is $\frac{160}{185}$ of $\frac{1}{8}$ of 1% = $\frac{4}{37}$ of 1%.

$\frac{4}{37}$ of 1% of 450 ft. is $\frac{1}{37}$ ft. = $5\frac{3}{7}$ in. *Ans.*

55. How much longer is 100 miles of iron rail at 118° F. than at 20° below zero?

The difference between -20° and $+118^{\circ}$ is 138° .

If $\frac{1}{2}$ of 1% is the expansion for 185° , the expansion for 138° is

$\frac{138}{185}$ of $\frac{1}{2}$ of 1% = $\frac{69}{925}$ of 1%

$\frac{69}{925}$ of 1% of 100 mi. is $\frac{69}{925}$ mi. = $492\frac{1}{2}$ ft. *Ans.*

$$\$686 = \$675.86.$$

$$\frac{675.86}{0.10} = 6758.6 \text{ yds. can be bought for } \$675.86, \text{ at } \$0.10. \text{ Ans.}$$

14. A commission merchant has consigned to him 500 bbls. of flour, which he sells at \$5.50 a barrel, and charges $2\frac{1}{2}\%$ commission; the expenses for freight, etc., amounted to \$250. With the net proceeds he buys sugar, at $6\frac{1}{4}$ cents a pound, charging $2\frac{1}{2}\%$ commission for buying. How much sugar does he buy, and what is the amount of his commissions?

$$\begin{array}{rcl} 500 \times \$5.50 & = & \$2750.00 \\ \$2750 \times 0.025 & = & \$68.75 \quad = \text{commission.} \\ \text{Freight, etc.} & = & 250.00 \\ \text{Total expenses} & = & \underline{\quad 318.75 \quad} \\ & & \$2431.25 \text{ net proceeds.} \end{array}$$

If 100 be taken to represent the amount to be paid for the sugar, $2\frac{1}{2}$ will represent the commission, and $102\frac{1}{2}$ will represent the \$2431.25. Therefore, the amount expended for sugar will be $\frac{100}{102\frac{1}{2}}$ of \$2431.25 = \$2371.95.

And $2\frac{1}{2}\%$ of \$2371.95 = \$59.30, commission.

Therefore, $\frac{2371.95}{0.06\frac{1}{4}}$ lbs. = 37,951.2 lbs. will be bought. (1) *Ans.*

\$68.75 + \$59.30 = \$128.05, whole commission. (2) *Ans.*

$$\begin{array}{r} 1100 \times \$4.50 = \$4950.00 \\ \$4950 \times 0.025 = \quad 123.75 = \text{commission.} \\ \hline \$4826.25 \end{array}$$

If 100 be taken to represent the amount to be paid for the steel, $1\frac{1}{2}$ will represent the commission, and $101\frac{1}{2}$ will represent the \$4826.25. Therefore, the amount expended for steel will be $\frac{100}{101\frac{1}{2}}$ of \$4826.25 = \$4754.93.

And $1\frac{1}{2}\%$ of \$4754.93 = \$71.32, commission.

\$123.75 + \$71.32 = \$195.07, total commission. (1) *Ans.*

If 100 be taken to represent the sum to be insured, $1\frac{3}{4}$ will represent the premium, and $100 - 1\frac{3}{4} = 98\frac{1}{4}$ will represent the value of the vessel.

Hence, the sum to be insured will be

$$\$12,052 \div 0.98\frac{1}{4} = \$12,266.67.$$

And $1\frac{3}{4}\%$ of \$12,266.67 = \$214.67, premium. *Ans.*

5. The premium for insurance at $1\frac{1}{4}\%$ is \$150. What is the amount insured?

If 100 be taken to represent the sum to be insured, $1\frac{1}{2}$ will represent the premium, and $100 - 1\frac{1}{2} = 98\frac{1}{2}$ will represent the value of the vessel.

Hence, the sum to be insured will be $\$96,084 \div 0.98\frac{1}{2} = \$97,920$.

14. S. Williams pays \$18.40 premium for insuring his house for $\frac{2}{3}$ of its value, at $1\frac{1}{2}\%$. What is the value of his house?

If $1\frac{1}{2}$ represent \$18.40, 100 will represent $\frac{100}{1\frac{1}{2}}$ of \$18.40 = \$1226 $\frac{2}{3}$.

If \$1226 $\frac{2}{3}$ is $\frac{2}{3}$, the whole is $\frac{3}{2}$ of \$1226 $\frac{2}{3}$ = \$1840. *Ans.*

EXERCISE LXX.

1. If James Brown be assessed \$2500 on his house, and \$5200 on personal property, and pays for 2 polls at \$1.50 each, how much will his tax be, the rate being \$12.18 on \$1000?

$$\$2500 + \$5200 = \$7700.$$

$$0.01218 \text{ of } \$7700 = \$93.79.$$

$$\$93.79 + \$3.00 = \$96.79. \textit{Ans.}$$

2. If the rate of tax be \$12.25 on \$1000, and the tax be \$11,788.50, what is the valuation?

$$\$12.25 \text{ on } \$1000 = 1.225\%$$

If 1.225 represent \$11,788.50, 100 will represent $\frac{100}{1.225}$ of

$$\$11,788.50 = \$962,326.53. \text{ Ans.}$$

3. If the assessed valuation of a town be \$1,777,000, and the property-tax be \$6870, what is the rate on \$1000?

$$\$6870 \div \$1,777,000 = 0.003866.$$

That is, the rate is 0.3866 of 1%, or \$3.866 on \$1000. *Ans.*

4. What sum must be assessed, in order that \$15,000 shall remain after paying a commission of 2% for collecting the taxes?

If 100 be taken to represent the sum to be assessed, 98 will represent the \$15,000.

Therefore, the sum to be assessed is $\frac{100}{98}$ of \$15,000 = \$15,306.12.

5. A tax of \$1857.60 is levied upon a school district for building a school-house. The assessed valuation of the district is \$1,935,000. What is the tax on property valued at \$6250?

$$\$1857.60 \div \$1,935,000 = 0.00096.$$

Therefore, tax on the property is 0.00096 of \$6250 = \$6.00. *Ans.*

6. In a certain town there are 1350 polls. The assessed value of the real estate is \$713,250; of the personal property is \$738,954; the poll-tax is \$2. The tax on property is $1\frac{1}{8}\%$. But only 96% of the tax can be collected, and the collector is paid $2\frac{1}{2}\%$ of the amount collected. How much does the town receive from the taxes?

$$\text{The amount of poll-taxes} = 1350 \times \$2 = \$2700.$$

$$\$713,250 + \$738,954 = \$1,452,204, \text{ assessed value.}$$

$$0.01\frac{1}{8} \text{ of } \$1,452,204 = \$16,337.31, \text{ amount to be raised on property.}$$

$$\$16,337.31 + \$2700 = \$19,037.31, \text{ amount to be raised.}$$

$$0.96 \text{ of } \$19,037.31 = \$18,275.82, \text{ amount collected.}$$

$$0.02\frac{1}{2} \text{ of } \$18,275.82 = \$456.90, \text{ collector's pay.}$$

$$\$18,275.82 - \$456.90 = \$17,818.92, \text{ amount town receives. Ans.}$$

7. What is the duty, at 20% *ad valorem* (that is, 20% of the cost), on 320 boxes of raisins, each containing 40 lbs., and costing 8 cents a pound?

$$320 \times 40 \times \$0.08 = \$1024.00.$$

$$0.20 \text{ of } \$1024 = \$204.80. \text{ Ans.}$$

8. What is the duty, at 6 cents a gallon, on 420 hhds. of molasses, 63 gals. in a hogshead?

$$420 \times 63 \times \$0.06 = \$1587.60. \text{ Ans.}$$

9. At 40%, what is the duty on 300 tons of iron (2240 lbs. to a ton) invoiced at $1\frac{1}{2}$ cents a pound?

$$300 \times 2240 \times \$0.01\frac{1}{2} = \$10,080.$$

$$0.40 \text{ of } \$10,080 = \$4032. \text{ Ans.}$$

10. Paid \$1360.80 duty on 300 hhds. of molasses, each containing 63 gals., at 25 cents a gallon. What was the rate per cent of duty?

$$300 \times 63 \times \$0.25 = \$4725.$$

If 100 be taken to represent \$4725, the number required to represent \$1360.80 is $\frac{\$1360.80}{\$4725}$ of 100 = $28\frac{4}{5}$.

That is, $28\frac{4}{5}\%$. Ans.

11. A sugar refiner imports 50 hhds. of sugar weighing 480 lbs. each, and 120 hhds. of molasses containing 63 gals. each. What is the amount of the duties, if the sugar pay 3 cents a pound, and the molasses 8 cents a gallon, an allowance being made on the sugar of 10%, and 2% on the molasses?

$$50 \times 480 \times \$0.03 = \$720.$$

$$0.90 \text{ of } \$720 = \$648.$$

$$120 \times 63 \times \$0.08 = \$604.80$$

$$0.98 \text{ of } \$604.80 = \$592.70.$$

$$\$648 + \$592.70 = \$1240.70. \text{ Ans.}$$

12. An importer paid \$825 duty on an invoice of silks, the duty being 24%. But damages of 15% were allowed at the custom-house. What was the entire cost of the goods?

If 24 represent \$825, 100 will represent $\frac{100}{24}$ of \$825 = \$3437.50.
 If 100 be taken to represent the cost, $100 - 15 = 85$ will represent the invoice price.
 $\frac{100}{85}$ of \$3437.50 = \$4044.12, cost.
 $\$4044.12 + \$825 = \$4869.12$. *Ans.*

13. Paid \$325 duty on goods which had been damaged, allowance for damage is 24%, and the duty was 24%. What was the invoice price of the goods?

If 24 represent \$325, 100 will represent $\frac{100}{24}$ of \$325 = \$1354.17.
 If 100 be taken to represent the cost, $100 - 24 = 76$ will represent the invoice price.
 Therefore, the invoice price was $\frac{100}{76}$ of \$1354.17 = \$1781.80.

EXERCISE LXXIII.

1. Find the cost of \$4000 stock, at 109 $\frac{1}{2}$.

If \$1 stock cost \$1.09 $\frac{1}{2}$, \$4000 stock will cost
 $4000 \times \$1.09\frac{1}{2} = \4395 . Ans.

2. Find the cost of \$2500 stock, at 98.

If \$1 stock cost \$0.98, \$2500 stock will cost
 $2500 \times \$0.98 = \2450 . Ans.

3. Find the cost of \$3900 stock, at $78\frac{1}{2}$.

If \$1 stock cost $\$0.78\frac{1}{2}$, \$3900 stock will cost
 $3900 \times \$0.78\frac{1}{2} = \3046.88 . *Ans.*

4. Find the cost of \$4700 stock, at $100\frac{1}{2}$.

If \$1 stock cost $\$1.00\frac{1}{2}$, \$4700 stock will cost
 $4700 \times \$1.00\frac{1}{2} = \4723.50 . *Ans.*

5. Find the cost of \$1250 stock, at $87\frac{3}{4}$, brokerage $\frac{1}{8}$.

If $\frac{1}{8}$ be the brokerage, $87\frac{3}{4} + \frac{1}{8} = 87\frac{5}{8}$ is total cost.

If \$1 stock cost $\$0.87\frac{5}{8}$, \$1250 stock will cost
 $1250 \times \$0.87\frac{5}{8} = \1096.88 . *Ans.*

6. How much bank stock, at $75\frac{1}{4}$, may be bought for \$8729?

If $\$0.75\frac{1}{4}$ buys \$1 stock, \$8729 will buy $\frac{\$8729}{0.75\frac{1}{4}} = \11600 . *Ans.*

7. How much railroad stock, at $91\frac{1}{8}$, may be bought for $\$4237\frac{5}{8}$?

If $\$0.91\frac{1}{8}$ buy \$1 stock, $\$4237\frac{5}{8}$ will buy $\frac{\$4237\frac{5}{8}}{0.91\frac{1}{8}} = \4650 .

8. How much railroad stock may be bought for \$6305, at $121\frac{1}{4}$?

If $\$1.21\frac{1}{4}$ buy \$1 stock, \$6305 will buy $\frac{\$6305}{1.21\frac{1}{4}} = \5200 . *Ans.*

9. How much railroad stock may be bought for \$5137.50, at $102\frac{3}{4}$?

If $\$102\frac{3}{4}$ buy \$1 stock, \$5137.50 will buy $\frac{\$5137.50}{1.02\frac{3}{4}} = \5000 .

10. How many \$100 railroad shares, at $68\frac{3}{4}$, may be bought for \$1650?

If 1 share cost $\$68\frac{3}{4}$, $\frac{\$1650}{68\frac{3}{4}} = 24$ shares can be bought for \$1650.

11. What must be the price of stock, in order that \$9200 stock may be bought for \$8970?

If \$9200 stock cost \$8970,

then \$1 stock costs $\$8970 \div 9200 = 0.97\frac{1}{2}$.

Hence, the stock is quoted at $97\frac{1}{2}$. *Ans.*

12. If \$1500 stock be bought for \$1374.375, what is the price of the stock?

If \$1500 stock cost \$1374.375,
 then \$1 stock costs $\$1374.375 \div 1500 = \$0.91\frac{1}{2}$.
 Hence, the stock is quoted at 91 $\frac{1}{2}$. *Ans.*

13. What income will be derived from \$29,700 4% stock?

0.04 of \$29,700 = \$1188. *Ans.*

14. Find the income from \$4500 6% stock.

0.06 of \$4500 = \$270. *Ans.*

15. How much will a person receive from \$9400 railroad stock if a dividend of 3 $\frac{1}{2}$ % be declared?

0.035 of \$9400 = \$329. *Ans.*

16. How much 8% stock must be bought to give an income of \$2400?

Since \$0.08 is derived from \$1 stock, \$2400 will be derived from
 $\$2400 \div 0.08 = \$30,000$. *Ans.*

17. A person receives \$343 as his semi-annual dividend from a 7% stock. How much stock does he hold?

Since \$0.07 is derived from \$1 stock, $2 \times \$343 = \686 will be
 derived from $\$686 \div 0.07 = \9800 . *Ans.*

Find the total income of a person whose property consists of
 \$3000 6% stocks and \$8200 7% stocks.

of \$3000 = \$180, income from 6% stocks.

of \$8200 = \$574, income from 7% stocks.

$\$180 + \$574 = \$754$, total income. *Ans.*

Find the rate of dividend paid by some stock, when a holder
 of \$24,600 receives \$924.50.

To be taken to represent \$24,600, the number required to
 present \$924.50 will be $\frac{\$924.50}{\$24600}$ of 100 = 3 $\frac{1}{2}$ $\frac{1}{2}$.

It is, 3 $\frac{1}{2}$ $\frac{1}{2}$ %. *Ans.*

20. Find the rate per cent at which \$11,100 will yield a semi-annual return of \$499.50.

If 100 be taken to represent \$11,100, the number required to represent $2 \times \$499.50 = \999 will be $\frac{\$999}{\$11100}$ of 100 = 9.

That is, 9%. *Ans.*

21. If \$19,500 be invested in 4% stock, at 91, what income will be received?

\$91 is the cost of \$100 stock.

Hence, \$19,500 = cost of $\frac{\$19500}{0.91} = \$21,428.57$ stock.

And 0.04 of \$21,428.57 = \$857.14. *Ans.*

22. Find the income on \$7000 when invested in 4% stock, at 103½.

\$103½ is the cost of \$100 stock.

Hence, \$7000 = cost of $\$7000 \div 1.03\frac{1}{2} = \6779.66 .

And 0.04 of \$6779.66 = \$271.19. *Ans.*

23. What income will be derived from \$6800 if it be invested in 7% stocks, at 130?

\$130 is the cost of \$100 stock.

Hence, \$6800 = cost of $\$6800 \div 1.30 = \5230.77 .

And 0.07 of \$5230.77 = \$366.15. *Ans.*

24. A person invests \$7650 in railroad stock, at 63½. What will he receive if a dividend of 3½% be declared?

\$63½ is the cost of \$100 stock.

Hence, \$7650 = cost of $\$7650 \div 0.63\frac{1}{2} = \$12,000$.

And 0.03½ of \$12,000 = \$390. *Ans.*

25. If 3% stocks are at 88½, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$88½. \$100 stock pays \$3.

Hence, the \$88½ invested pays \$3.

Therefore, the rate of interest is $3 \div 88\frac{1}{2} = 0.03\frac{1}{2}$ or 3½% *Ans.*

26. If an 8% stock is at 150, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$150. \$100 stock pays \$8.

Hence, the \$150 invested pays \$8.

Therefore, the rate of interest is $8 \div 150 = 0.05\frac{1}{3}$ or $5\frac{1}{3}\%$. *Ans.*

27. If a 10% stock is at 175, what rate per cent interest will an investor receive on his money?

\$100 stock costs \$175. \$100 stock pays \$10.

Hence, the \$175 invested pays \$10.

Therefore, the rate of interest is $10 \div 175 = 0.05\frac{2}{7}$ or $5\frac{2}{7}\%$. *Ans.*

28. If a $4\frac{1}{2}\%$ stock is at 85, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$85. \$100 stock pays \$4 $\frac{1}{2}$.

Hence, the \$85 invested pays \$4 $\frac{1}{2}$.

Therefore, the rate of interest is $4\frac{1}{2} \div 85 = 0.05\frac{1}{17} = 5\frac{1}{17}\%$. *Ans.*

29. If a 7% stock is at 114, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$114. \$100 stock pays \$7.

Hence, the \$114 invested pays \$7.

Therefore, the rate of interest is $7 \div 114 = 0.06\frac{1}{19}$ or $6\frac{1}{19}\%$. *Ans.*

30. If a 6% stock is at 130, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$130. \$100 stock pays \$6.

Hence, the \$130 invested pays \$6.

Therefore, the rate of interest is $6 \div 130 = 0.04\frac{3}{13}$ or $4\frac{3}{13}\%$. *Ans.*

31. If an 8% stock is at 140, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$140. \$100 stock pays \$8.

Hence, the \$140 invested pays \$8.

Therefore, the rate of interest is $8 \div 140 = 0.05\frac{2}{7}$ or $5\frac{2}{7}\%$. *Ans.*

32. How much money must be invested in 4% stock, at 92, to receive \$245 income?

\$100 stock costs \$92. \$100 stock pays \$4.

Hence, the \$92 invested pays \$4.

Therefore, the rate of interest is $4 \div 92 = 0.04\frac{2}{23}$ or $4\frac{2}{23}\%$.

Since $0.04\frac{2}{23}$ is derived from \$1 stock, \$245 will be derived from $\$245 \div 0.04\frac{2}{23} = \5635 . *Ans.*

33. Find the sum required for an investment in a 4% stock, at $98\frac{1}{2}$, to produce an income of \$200 a year.

\$100 stock cost \$98 $\frac{1}{2}$. \$100 stock pays \$4.

Hence, the \$98 $\frac{1}{2}$ invested pays \$4.

Therefore, the rate of interest is $4 \div 98\frac{1}{2} = 0.04\frac{2}{197}$ or $4\frac{2}{197}\%$.

Since $0.04\frac{2}{197}$ is derived from \$1 stock, \$200 will be derived from $\$200 \div 0.04\frac{2}{197} = \4925 . *Ans.*

34. A person bought some bank stock at 107, and received \$384.25 when a dividend of 7 $\frac{1}{4}\%$ was paid. How much had he invested?

Since $0.07\frac{1}{4}$ is derived from \$1 stock, \$384.25 will be derived from $\$384.25 \div 0.07\frac{1}{4} = \5300 .

\$5300 is the cost of 53 shares at 100.

Therefore, the cost of 53 shares at 107 will be $53 \times \$107 = \5671 .

35. What must be the price of a 5% stock, in order that a buyer may receive 6% on his money?

If \$100 pay \$5 at 5%, the number of dollars required to pay \$5 at 6% will be $\frac{5}{6}$ of \$100 = \$83 $\frac{1}{3}$.

That is, the stock is quoted at 83 $\frac{1}{3}$. *Ans.*

36. What must be the price of a 7% stock, in order that a buyer may receive 6% interest on his money?

If \$100 pay \$7 at 7%, the number of dollars required to pay \$7 at 6% will be $\frac{7}{6}$ of \$100 = \$116 $\frac{2}{3}$.

That is, the price of the stock will be 116 $\frac{2}{3}$. *Ans.*

37. What may be paid for an 8% stock, in order that a buyer may receive 6% interest on his money? for a 9% stock? for a 10% stock?

If \$100 pay \$8 at 8%, the number of dollars required to pay \$8 at 6% will be $\frac{8}{6}$ of \$100 = \$133 $\frac{1}{3}$.

That is, the price of the stock will be 133 $\frac{1}{3}$. (1) *Ans.*

If \$100 pay \$9 at 9%, the number of dollars required to pay \$9 at 6% will be $\frac{9}{6}$ of \$100 = \$150.

That is, the price of the stock will be 150. (2) *Ans.*

If \$100 pay \$10 at 10%, the number of dollars required to pay \$10 at 6% will be $\frac{10}{6}$ of \$100 = \$166 $\frac{2}{3}$.

That is, the price of the stock will be 166 $\frac{2}{3}$. (3) *Ans.*

38. A person invested \$2855 in a bank, when the stock was at 142 $\frac{1}{2}$. What is the rate per cent of the dividend when he receives \$150?

The number of shares is $\$2855 \div \$142\frac{1}{2} = 20$.

If 20 shares pay \$150, 1 share will pay $\frac{\$150}{20} = \$7\frac{1}{2}$.

That is, 7 $\frac{1}{2}$ %. *Ans.*

39. How much will be received for some 3% stock, from which an income of \$250 has been derived, if sold at 87 $\frac{1}{2}$?

Since \$0.03 is derived from \$1 stock, \$250 will be derived from $\$250 \div 0.03 = \$8333.33 = 83\frac{1}{3}$ shares.

83 $\frac{1}{3}$ shares at \$87 $\frac{1}{2}$ will cost $83\frac{1}{3} \times \$87\frac{1}{2} = \7291.67 . *Ans.*

40. If a 5% stock pays \$340 income, and is sold out for \$7990, at what price is it sold?

Since \$0.05 is derived from \$1 stock, \$340 will be derived from $\$340 \div 0.05 = \6800 .

If \$6800 stock be sold for \$7990, then \$1 is sold for $\$7990 \div 6800 = \$1.17\frac{1}{2}$.

Hence, the stock is sold at 117 $\frac{1}{2}$. *Ans.*

41. On what per cent stock must an investment have been made from which \$185.50 was derived yearly, and which, when sold out at 97, brought \$5141?

If 97 represent \$5141, 100 will represent $\frac{100}{97}$ of \$5141 = \$5300

The interest on \$5300 for 1 year is \$185.50;

on \$1 for 1 year is $\frac{\$185.50}{\$5300} = \$0.035$.

Hence, the rate is 3 $\frac{1}{2}$ %. *Ans.*

42. A person receives $4\frac{1}{2}\%$ interest on his money by investing it in some 6% stock. At what price did he buy it?

If \$100 pay \$6 at 6%, the number of dollars required to pay

\$6 at $4\frac{1}{2}\%$ is $\frac{6}{4\frac{1}{2}}$ of \$100 = \$144.

Therefore, the price of the stock was 144. *Ans.*

43. If \$4800 3% stocks be sold at 88, and the proceeds be invested in 5% stocks at 105 $\frac{1}{2}$, what additional income will be obtained?

0.03 of \$4800 = \$144, income from the 3% stock.

0.88 of \$4800 = \$4224, amount from the 3% stock.

\$1.056 is paid for \$1 worth of 5% stock.

Hence, \$4224 is paid for $\$4224 \div 1.056 = \4000 stock.

0.05 of \$4000 = \$200, income from 5% stock.

\$200 - \$144 = \$56, increase in income. *Ans.*

44. If \$7800 $3\frac{1}{2}\%$ stocks be sold at 60, and the proceeds be invested in 5% stocks at 90, find the alteration in income.

0.03 $\frac{1}{2}$ of \$7800 = \$273, income from the $3\frac{1}{2}\%$ stock.

0.60 of \$7800 = \$4680, amount from the $3\frac{1}{2}\%$ stock.

\$0.90 is paid for \$1 worth of 5% stock.

Hence, \$4680 is paid for $\$4680 \div 0.90 = \5200 .

0.05 of \$5200 = \$260, income from 5% stock.

\$273 - \$260 = \$13, decrease in income. *Ans.*

45. If \$10,000 3% stocks be sold at 88, and the proceeds be invested in $3\frac{1}{2}\%$ stock at par, find the alteration in income.

0.03 of \$10,000 = \$300, income from the 3% stock.

0.88 of \$10,000 = \$8800, amount from the 3% stock.

0.03 $\frac{1}{2}$ of \$8800 = \$308, income from the $3\frac{1}{2}\%$ stock.

\$308 - \$300 = \$8, increase in income. *Ans.*

46. If \$10,000 8% stocks be sold at 150, and the proceeds be invested in 6% stocks at par, find the alteration in income.

0.08 of \$10,000 = \$800, income from the 8% stock.

1.50 of \$10,000 = \$15,000, amount from the 8% stock.

0.06 of \$15,000 = \$900, income from the 6% stock.

\$900 - \$800 = \$100, increase in income. *Ans.*

45. What principal will produce \$100 in 1 yr. 6 mos., at 6% compound interest, payable semi-annually?

The amount of \$1 for 1 yr. 6 mos., payable semi-annually, is
 $\$1 \times 1.03^3 = \1.092727 .

The interest is $\$1.092727 - \$1 = \$0.092727$.

The principal is $\$100 + 0.092727 = \1078.43 . *Ans.*

EXERCISE LXXIII.

1. Find the cost of \$4000 stock, at 109 $\frac{1}{2}$.

If \$1 stock cost \$1.09 $\frac{1}{2}$, \$4000 stock will cost
 $4000 \times \$1.09\frac{1}{2} = \4395 . Ans.

2. Find the cost of \$2500 stock, at 98.

If \$1 stock cost \$0.98, \$2500 stock will cost
 $2500 \times \$0.98 = \2450 . Ans.

3. Find the cost of \$3900 stock, at $78\frac{1}{2}$.

If \$1 stock cost \$ $0.78\frac{1}{2}$, \$3900 stock will cost
 $3900 \times \$0.78\frac{1}{2} = \3046.88 . *Ans.*

4. Find the cost of \$4700 stock, at $100\frac{1}{2}$.

If \$1 stock cost \$ $1.00\frac{1}{2}$, \$4700 stock will cost
 $4700 \times \$1.00\frac{1}{2} = \4723.50 . *Ans.*

5. Find the cost of \$1250 stock, at $87\frac{3}{4}$, brokerage $\frac{1}{8}$.

If $\frac{1}{8}$ be the brokerage, $87\frac{3}{4} + \frac{1}{8} = 87\frac{5}{8}$ is total cost.

If \$1 stock cost \$ $0.87\frac{5}{8}$, \$1250 stock will cost
 $1250 \times \$0.87\frac{5}{8} = \1096.88 . *Ans.*

6. How much bank stock, at $75\frac{1}{4}$, may be bought for \$8729?

If \$ $0.75\frac{1}{4}$ buys \$1 stock, \$8729 will buy $\frac{\$8729}{0.75\frac{1}{4}} = \11600 . *Ans.*

7. How much railroad stock, at $91\frac{1}{8}$, may be bought for \$4237 $\frac{5}{8}$?

If \$ $0.91\frac{1}{8}$ buy \$1 stock, \$4237 $\frac{5}{8}$ will buy $\frac{\$4237\frac{5}{8}}{0.91\frac{1}{8}} = \4650 .

8. How much railroad stock may be bought for \$6305, at $121\frac{1}{4}$?

If \$ $1.21\frac{1}{4}$ buy \$1 stock, \$6305 will buy $\frac{\$6305}{1.21\frac{1}{4}} = \5200 . *Ans.*

9. How much railroad stock may be bought for \$5137.50, at $102\frac{3}{4}$?

If \$ $102\frac{3}{4}$ buy \$1 stock, \$5137.50 will buy $\frac{\$5137.50}{1.02\frac{3}{4}} = \5000 .

10. How many \$100 railroad shares, at $68\frac{3}{4}$, may be bought for \$1650?

If 1 share cost \$ $68\frac{3}{4}$, $\frac{\$1650}{68\frac{3}{4}} = 24$ shares can be bought for \$1650.

11. What must be the price of stock, in order that \$9200 stock may be bought for \$8970?

If \$9200 stock cost \$8970,

then \$1 stock costs $\$8970 \div 9200 = 0.97\frac{1}{2}$.

Hence, the stock is quoted at $97\frac{1}{2}$. *Ans.*

12. If \$1500 stock be bought for \$1374.375, what is the price of the stock?

If \$1500 stock cost \$1374.375,

then \$1 stock costs $\$1374.375 \div 1500 = \$0.91\frac{1}{2}$.

Hence, the stock is quoted at $91\frac{1}{2}$. *Ans.*

13. What income will be derived from \$29,700 4% stock?

0.04 of \$29,700 = \$1188. *Ans.*

14. Find the income from \$4500 6% stock.

0.06 of \$4500 = \$270. *Ans.*

15. How much will a person receive from \$9400 railroad stock if a dividend of $3\frac{1}{2}\%$ be declared?

0.035 of \$9400 = \$329. *Ans.*

16. How much 8% stock must be bought to give an income of \$2400?

Since \$0.08 is derived from \$1 stock, \$2400 will be derived from $\$2400 \div 0.08 = \$30,000$. *Ans.*

17. A person receives \$343 as his semi-annual dividend from a 7% stock. How much stock does he hold?

Since \$0.07 is derived from \$1 stock, $2 \times \$343 = \686 will be derived from $\$686 \div 0.07 = \9800 . *Ans.*

18. Find the total income of a person whose property consists of \$3000 6% stocks and \$8200 7% stocks.

0.06 of \$3000 = \$180, income from 6% stocks.

0.07 of \$8200 = \$574, income from 7% stocks.

$\$180 + \$574 = \$754$, total income. *Ans.*

19. Find the rate of dividend paid by some stock, when a holder of \$24,600 receives \$924.50.

If 100 be taken to represent \$24,600, the number required to represent \$924.50 will be $\frac{\$924.50}{\$24600}$ of 100 = $3\frac{1}{2}\frac{1}{2}$.

That is, $3\frac{1}{2}\frac{1}{2}\%$. *Ans.*

20. Find the rate per cent at which \$11,100 will yield a semi-annual return of \$499.50.

If 100 be taken to represent \$11,100, the number required to represent $2 \times \$499.50 = \999 will be $\frac{\$999}{\$11100}$ of 100 = 9.

That is, 9%. *Ans.*

21. If \$19,500 be invested in 4% stock, at 91, what income will be received?

\$91 is the cost of \$100 stock.

Hence, \$19,500 = cost of $\frac{\$19500}{0.91} = \$21,428.57$ stock.

And 0.04 of \$21,428.57 = \$857.14. *Ans.*

22. Find the income on \$7000 when invested in 4% stock, at 103½.

\$103½ is the cost of \$100 stock.

Hence, \$7000 = cost of $\$7000 \div 1.03\frac{1}{2} = \6779.66 .

And 0.04 of \$6779.66 = \$271.19. *Ans.*

23. What income will be derived from \$6800 if it be invested in 7% stocks, at 130?

\$130 is the cost of \$100 stock.

Hence, \$6800 = cost of $\$6800 \div 1.30 = \5230.77 .

And 0.07 of \$5230.77 = \$366.15. *Ans.*

24. A person invests \$7650 in railroad stock, at 63½. What will he receive if a dividend of 3½% be declared?

\$63½ is the cost of \$100 stock.

Hence, \$7650 = cost of $\$7650 \div 0.63\frac{1}{2} = \$12,000$.

And 0.03½ of \$12,000 = \$390. *Ans.*

25. If 3% stocks are at 88½, what rate per cent interest will a purchaser receive on his money?

\$100 stock costs \$88½. \$100 stock pays \$3.

9. In what proportions must tin of specific gravity 7.29 and lead of specific gravity 11.35 be mixed to make a solder of specific gravity 10.21, if no allowance be made for expansion or condensation? (Give the proportions in bulk.)

The specific gravity of tin lacks 2.92 of the required specific gravity; and the specific gravity of lead is 1.14 above the required specific gravity.

Therefore, the tin is to the lead in the inverse ratio of 292 to 114. That is,

Tin : lead = 114 : 292 = 57 : 146. *Ans.*

10. In what proportions must oils worth \$1.25 and 80 cents a gallon be mixed to make a mixture worth \$1 a gallon? (Test the answer.)

The cost of the better oil is \$0.25 above the required cost; and the cost of the worse oil lacks \$0.20 of the required cost.

Therefore, the better is to the worse in the inverse ratio of \$0.25 to \$0.20. That is,

The better : the worse = 20 : 25 = 4 : 5. *Ans.*

11. In what proportion may oils worth \$1.20, 80 cents, and 60 cents a gallon be mixed so that the mixture shall be worth 70 cents a gallon?

When the 80-cent oil alone is taken, in what ratio to the 60-cent must it be used? When the \$1.20 oil alone is taken, in what ratio to the 60-cent oil must it be used? When the \$1.20 and 80-cent oils are mixed gallon for gallon, how much 60-cent oil must be added? When 1 gal. of the \$1.20 oil and 3 of the 80-cent oil are taken, how much 60-cent oil must be added? If three-fourths of the mixture consist of the 60-cent oil, what per cent of each of the other two must be taken?

(1)

The cost of the \$1.20 is \$0.50 above the required cost; the cost of the \$0.80 oil is \$0.10 above the required cost; and the cost of the \$0.60 oil lacks \$0.10 of the required cost.

Therefore, the \$1.20 oil is to the \$0.80 oil is to the \$0.60 oil in the inverse ratio of 50 to 10 to 10. That is,

The \$1.20 oil : the \$0.80 oil : the \$0.60 oil = 10 : 10 : 50 = 1 : 1 : 5.

(2)

The cost of the \$0.80 oil is \$0.10 above the required cost; the cost of the \$0.60 oil lacks \$0.10 of the required cost.

Therefore, the \$0.80 oil is to the \$0.60 oil in the inverse ratio of 10 to 10. That is,

The \$0.80 oil : the \$0.60 oil = 10 : 10 = 1 : 1. *Ans.*

(3)

The cost of the \$1.20 oil is \$0.50 above the required cost; and the cost of the \$0.60 oil lacks \$0.10 of the required cost.

Therefore, the \$1.20 oil is to the \$0.60 oil in the inverse ratio of 50 to 10. That is,

The \$1.20 oil : the \$0.60 oil = 10 : 50 = 1 : 5. *Ans.*

(4)

When 1 gal. of the \$1.20 oil is mixed with 1 gal. of the \$0.80 oil, the mixture costs $\frac{\$1.20 + \$0.80}{2} = \$1.00$ per gallon.

The cost of the \$1.00 oil is \$0.30 above the required cost; the cost of the \$0.60 oil lacks \$0.10 of the required cost.

Therefore, the \$1.00 oil is to the \$0.60 oil in the inverse ratio of 30 : 10. That is,

The \$1.00 oil is to the \$0.60 oil = 10 : 30 = 1 : 3.

1 : 3 :: 2 gals. : what?

1 : 3 :: 2 gals. : 6 gals. *Ans.*

(5)

When 1 gal. of the \$1.20 oil is mixed with 3 gals. of the \$0.80 oil, the mixture costs $\frac{\$1.20 + 3 \times \$0.80}{4} = \$0.90$ per gal.

The cost of the \$0.90 oil is \$0.20 above the required cost; the cost of the \$0.60 oil lacks \$0.10 of the required cost.

Therefore, the \$0.90 oil is to the \$0.60 oil in the inverse ratio of 20 : 10. That is,

The \$0.90 oil : the \$0.60 oil = 10 : 20 = 1 : 2.

1 : 2 :: 4 gals. : what?

1 : 2 :: 4 gals. : 8 gals. *Ans.*

(6)

Each of the others will be $\frac{1 - \frac{2}{3}}{2} = \frac{1}{6}$ of the whole, or $12\frac{1}{2}\%$. *Ans.*

12. A solder composed of tin and lead, specific gravities 7.29 and 11.35, has a specific gravity of 10.44. What is the weight of each metal in a kilogram of solder?

$$\text{Gain on tin} = 10.44 - 7.29 = 3.15.$$

$$\text{Loss on lead} = 11.35 - 10.44 = 0.91.$$

Ratio = 3.15 : 0.91 ; or, as more lead will be needed, 3.15 parts of lead to 0.91 parts of tin in 4.06 parts of solder.

Therefore, the weight of tin is $\frac{0.91}{4.06}$ of $\frac{729}{1044}$ of 1000g = 156.5g.

And the weight of lead is $\frac{3.15}{4.06}$ of $\frac{1135}{1044}$ of 1000g = 843.5g. *Ans.*

24.

Differences in equated time = 35 dys.

Balance of account = \$1000 - \$950 = \$50.

If the account were settled at the later date, May 17, the \$1000 on the Cr. side would have been on interest 35 dys., and this is equivalent to having the balance, \$50, on interest $1\frac{2}{3}\%$ of 35 dys. = 700 dys. Hence, the balance should begin to draw interest 700 dys. before May 17, 1881; that is, June 17, 1879.

25.

The difference in equated time = 35 dys.

Balance of account = \$1000 - \$950 = \$50.

If the account were settled at the later date, May 17, the \$950 would have been on interest 35 dys., which is equivalent to having the balance, \$50, on interest $2\frac{1}{2}\%$ of 35 dys. = 665 dys. Hence, to increase the Cr. side by an equal amount of interest, the balance should remain unpaid 665 dys.; that is, the balance is due March 13, 1883.

26.

The difference in equated time = 24 dys.

Balance of account = \$1000 - \$920 = \$80.

If the account were settled at the later date, June 23, the \$1000 on the Dr. side would have been on interest 24 dys., and this is equivalent to having the balance, \$80, on interest $1\frac{2}{3}\%$ of 24 dys. = 300 dys.

Hence, the balance should begin to draw interest 300 dys. before June 23, 1881; that is, Aug. 27, 1880.

27.

The difference in equated time is 83 dys.

Balance of account = \$20.

If the account were settled at the later date, July 6, the \$480 would have been on interest 83 dys., which is equivalent to having the balance, \$20, on interest $4\frac{2}{3}\%$ of 83 dys. = 1992 dys. Hence, to increase the Dr. side by an equal amount of interest, the balance should remain unpaid 1992 dys.; that is, the balance is due Dec. 19, 1886.

EXERCISE LXXXIV.

1. What number is 3 less than its square?

Assume 2.3 and 2.4.

$$2.3^2 - 2.3 = 5.29 - 2.3 = 2.99, \text{ an error of } -0.01.$$

$$2.4^2 - 2.4 = 5.76 - 2.4 = 3.36, \text{ an error of } +0.36.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.37.

$$\text{Hence, error of } 2.3 : 0.1 :: 0.01 : 0.37,$$

$$\text{or, error of } 2.3 : 0.1 :: 1 : 37.$$

$$\text{Therefore, the error of } 2.3 = \frac{1 \times 0.1}{37} = 0.0028.$$

$$2.3 + 0.0028 = 2.3028. \text{ } \textit{Ans.}$$

2. A flag-staff 50 ft. high broke, and the top falling over rested one end on the stump and the other 17 ft. from its base. How high was the stump?

Assume 22 ft. and 23 ft.

$$22^2 + 17^2 = 484 + 289 = 773, \text{ an error of } -11.$$

$$23^2 + 17^2 = 529 + 289 = 818, \text{ an error of } +89.$$

The difference of the assumed numbers is 1, and the difference of the errors is 100.

Hence, the error of $22 : 1 :: 11 : 100$.

$$\text{Therefore, the error of } 22 = \frac{1 \times 11}{100} = 0.11.$$

$$22 + 0.111 = 22.11 \text{ ft. } \textit{Ans.}$$

3. What number added to eight times its reciprocal is equal to 8?

Assume 1.1 and 1.2.

$$1.1 + 8 \times \frac{1}{1.1} = 1.1 + 7.273 = 8.373, \text{ an error of } +0.373.$$

$$1.2 + 8 \times \frac{1}{1.2} = 1.2 + 6.667 = 7.867, \text{ an error of } -0.133.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.506.

Hence, the error of $1.1 : 0.1 :: 0.373 : 0.506$,
or, the error of $1.1 : 0.1 :: 373 : 506$.

$$\text{Therefore, the error of } 1.1 = \frac{1 \times 373}{506} = 0.0737.$$

$$1.1 + 0.0737 = 1.1737. \textit{ Ans.}$$

Assume 6.8 and 6.9.

$$6.8 + 8 \times \frac{1}{6.8} = 6.8 + 1.177 = 7.977, \text{ an error of } -0.023.$$

$$6.9 + 8 \times \frac{1}{6.9} = 6.9 + 1.159 = 8.059, \text{ an error of } +0.059.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.082.

Hence, the error of $6.8 : 0.1 :: 0.023 : 0.082$,
or, the error of $6.8 : 0.1 :: 23 : 82$.

$$\text{Therefore, the error of } 6.8 = \frac{1 \times 23}{82} = 0.028.$$

$$6.8 + 0.028 = 6.828. \textit{ Ans.}$$

4. Find a number whose reciprocal is equal to 4 minus the number.

Assume 3 and 4.

$$\frac{1}{3} = 4 - 3, \text{ or } \frac{1}{3} = 1, \text{ an error of } +\frac{2}{3}.$$

$$\frac{1}{4} = 4 - 4, \text{ or } \frac{1}{4} = 0, \text{ an error of } -\frac{1}{4}.$$

The difference of the assumed numbers is 1, and the difference of the errors is $\frac{1}{2}$.

$$\text{Hence, the error of } 3 : 1 :: \frac{2}{3} : \frac{1}{2},$$

$$\text{or, the error of } 3 : 1 :: 8 : 11.$$

$$\text{Therefore, the error of } 3 = \frac{1 \times 8}{11} = 0.73.$$

$$3 + 0.73 = 3.73. \text{ Ans.}$$

Assume 0.26 and 0.27.

$$\frac{1}{0.26} = 4 - 0.26, \text{ or } 3.846 = 3.74, \text{ an error of } -0.106.$$

$$\frac{1}{0.27} = 4 - 0.27, \text{ or } 3.704 = 3.73, \text{ an error of } +0.026.$$

The difference of the assumed numbers is 0.01, and the difference of the errors is 0.132.

$$\text{Hence, the error of } 0.26 : 0.01 :: 0.106 : 0.132,$$

$$\text{or, the error of } 0.26 : 0.01 :: 53 : 66.$$

$$\text{Therefore, the error of } 0.26 = \frac{0.01 \times 53}{66} = 0.008.$$

$$0.26 + 0.008 = 0.268. \text{ Ans.}$$

5. What number is ten times its own logarithm?

Assume 1.3 and 1.5.

$$1.3 = 10 \times 0.1139, \text{ or } 1.3 = 1.139, \text{ an error of } -0.161.$$

$$1.5 = 10 \times 0.1761, \text{ or } 1.5 = 1.761, \text{ an error of } +0.261.$$

The difference of the assumed numbers is 0.2, and the difference of the errors is 0.422.

$$\text{Hence, the error of } 1.3 : 0.2 :: 0.161 : 0.422,$$

$$\text{or, the error of } 1.3 : 0.2 :: 161 : 422.$$

$$\text{Therefore, the error of } 1.3 = \frac{161 \times 0.2}{422} = 0.07$$

Assume 1.37 and 1.38.

$1.37 = 10 \times 0.1367$, or $1.37 = 1.367$, an error of -0.003 .

$1.38 = 10 \times 0.1399$, or $1.38 = 1.399$, an error of $+0.019$.

The difference of the assumed numbers is 0.01, and the difference of the errors is 0.022.

Hence, the error of $1.37 : 0.01 :: 0.003 : 0.022$.

or, the error of $1.37 : 0.01 :: 3 : 22$

Therefore, the error of $1.37 = \frac{3 \times 0.01}{22} = 0.0013$.

Therefore the number is $1.37 + 0.0013 = 1.3713$. *Ans.*

Assume 2.8 and 2.9.

$2\sqrt[3]{2.8} = 2.82$, an error of $+0.02$.

$2\sqrt[3]{2.9} = 2.85$, an error of -0.05 .

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.07.

Hence, the error of $2.8 : 0.1 :: 0.02 : 0.07$,

or, the error of $2.8 : 0.1 :: 2 : 7$.

Therefore, the error of $2.8 = \frac{0.1 \times 2}{7} = 0.0284$.

$2.8 + 0.0284 = 2.8284$. *Ans.*

7. What number exceeds its cube root by $6\frac{1}{4}$?

Assume 8.2 and 8.3.

$8.2 - \sqrt[3]{8.2} = 6.184$, an error of -0.066 .

$8.3 - \sqrt[3]{8.3} = 6.275$, an error of $+0.025$.

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.091.

Hence, the error of $8.2 : 0.1 :: 0.066 : 0.091$,

or, the error of $8.2 : 0.1 :: 66 : 91$.

Therefore, the error of $8.2 = \frac{0.1 \times 66}{91} = 0.072$.

$8.2 + 0.072 = 8.272$. *Ans.*

8. What is the number which added to its own square makes 11?

Assume 2.8 and 2.9.

$$2.8 + 2.8^2 = 10.64, \text{ an error of } -0.36.$$

$$2.9 + 2.9^2 = 11.31, \text{ an error of } +0.31.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.67.

$$\text{Hence, the error of } 2.8 : 0.1 :: 0.36 : 0.67,$$

$$\text{or, the error of } 2.8 : 0.1 :: 36 : 67.$$

$$\text{Therefore, the error of } 2.8 = \frac{0.1 \times 36}{67} = 0.054.$$

$$2.8 + 0.054 = 2.854. \text{ Ans.}$$

9. What is the number which multiplied by 10 makes 8 more than the square of the number?

Assume 9.1 and 9.2.

$$10 \times 9.1 = 9.1^2 + 8, \text{ or } 91 = 90.81, \text{ an error of } -0.19.$$

$$10 \times 9.2 = 9.2^2 + 8, \text{ or } 92 = 92.64, \text{ an error of } +0.64.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.83.

$$\text{Hence, the error of } 9.1 : 0.1 :: 0.19 : 0.83$$

$$\text{or, the error of } 9.1 : 0.1 :: 19 : 83.$$

$$\text{Therefore, the error of } 9.1 = \frac{0.1 \times 19}{83} = 0.023.$$

$$9.1 + 0.023 = 9.123. \text{ Ans.}$$

Assume 0.87 and 0.88.

$$10 \times 0.87 = 0.87^2 + 8, \text{ or } 8.7 = 8.7569, \text{ an error of } +0.0569.$$

$$10 \times 0.88 = 0.88^2 + 8, \text{ or } 8.8 = 8.7744, \text{ an error of } -0.0256.$$

The difference of the assumed numbers is 0.01, and the difference of the errors is 0.0825.

$$\text{Hence, the error of } 0.87 : 0.01 :: 0.0569 : 0.0825,$$

$$\text{or, the error of } 0.87 : 0.01 :: 569 : 825.$$

$$\text{Therefore, the error of } 0.87 = \frac{0.01 \times 569}{825} = 0.0069.$$

$$0.87 + 0.0069 = 0.8769. \text{ Ans.}$$

10. A certain number is equal to the sum of $\frac{1}{4}$ its own cube plus $\frac{1}{4}$ its own square. What is the number?

Assume 1.81 and 1.82.

$$\frac{1.81^3}{6} + \frac{1.81^2}{4} = 1.8073, \text{ an error of } -0.0027.$$

$$\frac{1.82^3}{6} + \frac{1.82^2}{4} = 1.8329, \text{ an error of } +0.0128.$$

The difference of the assumed numbers is 0.01, and the difference of the errors is 0.0156.

Hence, the error of 1.81 : 0.01 :: 0.0027 : 0.0156,
or, the error of 1.81 : 0.01 :: 9 : 52.

Therefore, the error of 1.81 = $\frac{0.01 \times 9}{52} = 0.0017$.

$$1.81 + 0.0017 = 1.8117. \text{ Ans.}$$

11. What number is equal to its square minus three times its logarithm?

Assume 1.1 and 1.2.

$$1.1^2 - 3 \times 0.0414 = 1.0858, \text{ an error of } -0.0142.$$

$$1.2^2 - 3 \times 0.0792 = 1.2024, \text{ an error of } +0.0024.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.0166.

Hence, the error of 1.1 : 0.1 :: 0.0142 : 0.0166,
or, the error of 1.1 : 0.1 :: 71 : 83.

Therefore, the error of 1.1 = $\frac{0.1 \times 71}{83} = 0.086$.

$$1.1 + 0.086 = 1.186. \text{ Ans.}$$

12. The sum of the square and the square root of a number, being divided by 1 plus the number, gives a quotient of $2\frac{1}{2}$. What is the number?

Assume 2.7 and 2.8.

$$\frac{2.7^2 + \sqrt{2.7}}{1 + 2.7} = \frac{8.933}{3.7} = 2.415, \text{ an error of } -0.085.$$

$$\frac{2.8^2 + \sqrt{2.8}}{1 + 2.8} = \frac{9.513}{3.8} = 2.503, \text{ an error of } + 0.003.$$

The difference of the assumed numbers is 0.1, and the difference of the errors is 0.088.

Hence, the error of $2.7 : 0.1 :: 0.085 : 0.088$,

or, the error of $2.7 : 0.1 :: 85 : 88$.

Therefore, the error of $2.7 = \frac{0.1 \times 85}{88} = 0.096$.

$$2.7 + 0.096 = 2.796. \text{ Ans.}$$

If the selling price is 92, and we wish it to be 115, we must add 23, or $\frac{1}{4}$ of 92. That is, we must add $\frac{1}{4}$ of 60 cts. = 15 cts. a pound. *Ans.*

34. Divide \$27.12 $\frac{1}{2}$ among three persons, giving the second \$5 less than the first, and twice as much as the third.

Let a represent the amount given to the first.

$a - 5$ will represent the amount given to the second.

$\frac{a}{2} - \frac{5}{2}$ will represent the amount given to the third.

Then, $2\frac{1}{2}a - 7\frac{1}{2}$ will represent the amount given to all three.

But \$27.12½ is the amount given to all three.

Hence, $2\frac{1}{2}a - 7\frac{1}{2} = 27.12\frac{1}{2}$.

Add to each side $7\frac{1}{2}$, $2\frac{1}{2}a = 34.625$

Divide each side by $2\frac{1}{2}$, $a = 13.85$

$$a - 5 = 8.85$$

$$12,298 + 0.91\frac{1}{3} = 13,416, \text{ population in 1870.}$$

0.94½ of \$2500 = \$2362.50, amount from the 3% stock.

\$1.05 is paid for \$1 worth of 4% stock.

Hence, \$2362.50 is paid for $2362.50 + 1.05 = \$2250$ stock.

0.04 of \$2250 = \$90, income from 4% stock.

\$90 - \$75 = \$15, increase of income. *Ans.*

111. Find the lifting-power of a hydraulic press, the plunger being 1^{cm} in diameter and driven with a force of 100^{ks}, if the lifting-piston is 1^m in diameter.

Suppose the plunger and piston square: the one would press on a surface of 1^{cm}, the other on a surface of 10,000^{cm}. By driving the plunger in 10^{cm}, you force 10^{cm} of water under the piston. But as this is spread under 10,000^{cm}, you raise the piston thereby only 0.001^{cm}; that is, only 0.0001 part of the way you move the plunger. Hence, by the principle of virtual velocity (what is lost in time is gained in power), you lift the piston with 10,000 times your force of 100^{ks} applied. The lifting power, in other words, is 1,000,000^{ks}, or 1000^t.

194. What must be the length of spermaceti candles $\frac{7}{8}$ of an inch in diameter, that 6 of them may weigh a pound, if the specific gravity of spermaceti is 0.943?

$$V = 0.7854 \times \frac{7^2}{8^2} \times h \times 6 \text{ cu. in.}$$

1 lb. is the weight of $\frac{1728}{0.943 \times 62.5}$ cu. in. of spermaceti.

$$\text{Hence } 0.7854 \times \frac{7^2}{8^2} \times h \times 6 = \frac{1728}{0.943 \times 62.5}.$$

$\text{Fe} = 56$ and $\text{O} = 16$. $16 : 56 = 2 : 7$. $30 : 70 = 3 : 7$.

First seek multiples of 16 and 56 in the proportion of 30 to 70; that is, of 3 to 7. $\therefore \text{Fe} : \text{O} = 2 : 3$.

232. If the composition of copperas is sulphuric acid 28.9%, oxide of iron 25.7%, water 45.4%, what is its formula?

Water being 18, oxide of iron being 72, and sulphuric acid 80, first seek multiples of 72 and 80, in the proportion of 25.7 to 28.9; that is, of 0.8892 to 1. But it is evident that 72 and 80 are in almost exactly that proportion. This gives FeSO_4 + water; and the remaining question is to find a multiple of 18 which is to 152 as 45.4 is to 54.6; that is, which is 0.8315 of 152, or 126.4. But $7 \times 18 = 126$; and the addition of 7 parts of water gives as the complete formula, $\text{FeSO}_4 + 7 \text{H}_2\text{O}$. *Ans.*

233. Spirits of turpentine is 11.76% hydrogen and 88.24% carbon. Give a chemical formula which will express that fact. Compare now with camphor, $\text{C}_{10}\text{H}_{16}\text{O}$. What per cent of oxygen combined with spirits of turpentine are required to make camphor?

Hydrogen being 1 and carbon 12, and 88.24 being almost exactly 7.5 times 11.76, we seek the smallest multiple of 12 that is 7.5 times a whole number. This is evidently 5 times 12, equal to 7.5 times 8. Therefore the formula is C_5H_8 . (1) *Ans.*

Double it and add O, and we have $\text{C}_{10}\text{H}_{16}\text{O}$, the formula of camphor; containing $16 + 136 = 152$ of oxygen added to spirits of turpentine. (2) *Ans.*

234. Out of the ten digits, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, how many numbers each consisting of two figures can be formed?

The numbers actually formed are those from 10 to 99; 90 in all. To show how many can be formed, consider that each digit may be followed by itself or by any of the other 9, giving 100 sequences of 2 figures; but 10 of these begin with 0, and are to be rejected, leaving 90. *Ans.*

236. With the digits 0, 1, 2, 3, 4, 5, how many numbers between 1000 and 4000 can be formed?

The digit in the thousands' place must be 1, 2, or 3. Each of these may be followed in the hundreds' place by each of the 6 given digits, making 18 different hundreds. Each of these may be followed in the tens' place by each of the 6, giving 108 different tens; each of which may have 6 digits, giving 648 numbers if we include the 1000. *Ans.*

237. How many dominoes are there in a set numbered from double-blank to double-nine?

By a domino is meant two numbers, side by side. Double-blank is 00. The next pieces introducing 1 are 01, 11; those introducing 2 are 02, 12, 22. Every number introduced requires new pieces exceeding by one the number introduced. Thus, as we have seen that to go to double-2 requires 6, to go to double-3 will require $6 + 4 = 10$ pieces; double-4, $10 + 5 = 15$ pieces. The ordinary set is $15 + 6 + 7 = 28$ pieces; and for double-9's we should require $28 + 8 + 9 + 10 = 55$ pieces.

Ans.

238. How many different amounts can be weighed with 1-lb., 2-lb., 4-lb., 8-lb., and 16-lb. weights?
